THIS NEW TYPE SPARK PLUG PEPS UP PICKUP.. STEPS UP TOP SPEED.. STOPS GAS WASTE .. GIVES EASIER STARTING

#### LESS STRESS ON ENTIRE IGNITION SYSTEM

These pictures give you a quick idea of the difference between the action of Auto-Lite Spark Plugs and others. By sparking at reduced voltages, Auto-Lites ease the load, and better the action of the entire ignition system.

# say MOTOR CAR OWNERS BY THOUSANDS

To the eye, this new Auto-Lite spark plug is the same as all the others. But in your car its performance as a unit of the ignition system is entirely different—more efficient!

Reason number one is the newAuto-Lite Konium Electrode with its "geometric" gap design. In everyday language, this new electrode makes it easier for all the ignition units to work together and produce the vital operating spark. Konium and its more efficient "geometric" gap design were developed by Auto-Lite research engineers to pro-

duce a spark at reduced voltages—and increase the firing certainty of the entire ignition system!

Leading motor car engineers carefully examined the performance of this new kind of spark plug, and today one out of every four new cars sold is factory-equipped with Auto-Lites. That's an endorsement that's hard to get! No matter what kind of car you drive you'll notice immediately its improved per-

formance — Auto-Lites "put new life in your motor!"

AUTO-LITE 1938 PARADE OF STARS

Lovely, expite Particleme, DANIELLE DARRIEUX, in her new Universal pieture "The Rage of Parls" leads the 1938 Parade of Stars. Ask your Auto-Lite dealer for an autographed photograph.

DEALERS AND SERVICE STATIONS:

In the next few months mitlions of motorists will be told in dynamic advertising the advantages and benefits of this sensational new spark plug. Write The Electric Auto-Lite Co., Dept. PMS, Toledo, Ohio, for 1938 merchandising plan.

AUTO-LITE SPARK

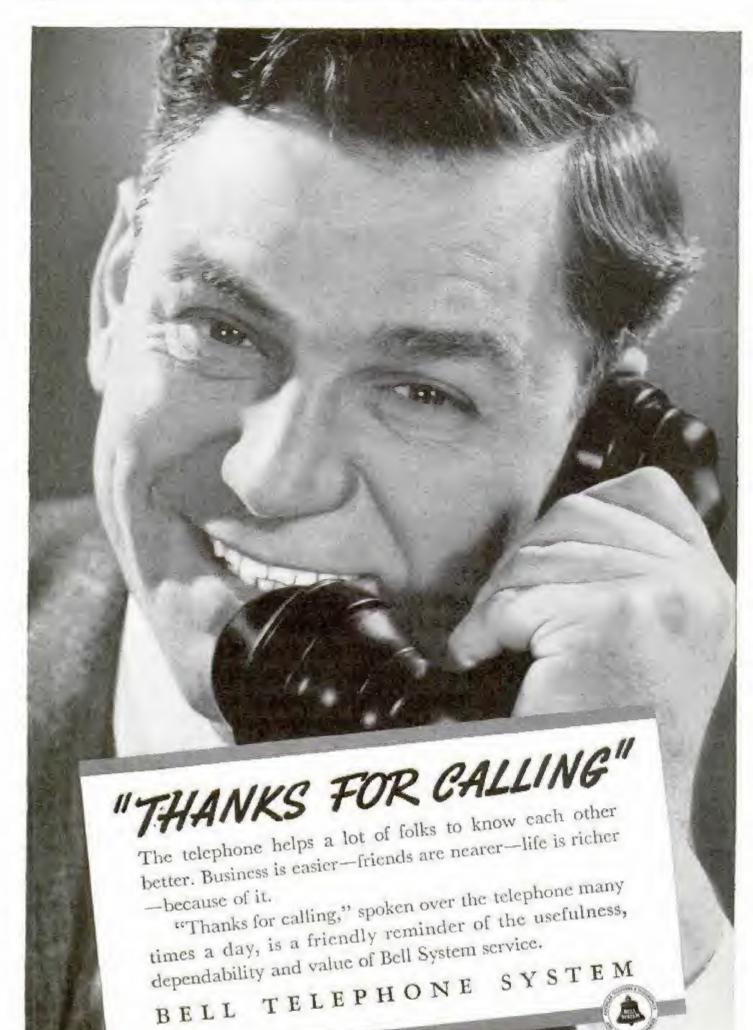

Your automobile requires pure oil . . . oil that will not break down into sludge, carbon or corrosionforming elements.

Acid-Free Quaker State is a scientific achievement in motor oil purity. In four, great modern refineries . . . operating under the most exacting control . . . the finest Pennsylvania crude oil is freed of all trace of impurities. Every drop of Acid-Free Quaker State Motor Oil is rich, pure lubricant. Retail price, 35¢ a quart. Quaker State Oil Refining Corporation, Oil City, Pennsylvania.

#### Why Is Grass Green?

A COMPLETE answer to this simple question would solve one of the great riddles of science. The schoolboy will tell you that grass is green because of 'chlorophyll, the active tie between the sun's energy and life. But how does it work? That's the puzzle. The whole earth receives energy from the sun but the green leaf uses this energy. Without chlorophyll, no life could exist on land for it is the ultimate source of all materials. Solving the secrets of chlorophyll may mean longer life, better health, absolute conservation of natural resources, reduction of living costs, a great rise in standards of living and an entirely new era of power and energy, an age in which an automobile may run 200 miles on a gallon of fuel. An article in the September issue discusses this riddle and the results which may be expected when science finally solves it.

#### Next Month

IF YOU have what it takes, Uncle Sam will pay you a salary while he teaches you to pilot one of his great "Flying Fortresses." An article next month tells you how to take advantage of this opportunity. The story is illustrated with eight pages of Coloroto pictures taken at March Field.

#### Our "Dumb" Friends

BEFORE you again refer to dogs, cows and horses as "our 'dumb' friends," consider "Skippy," "Whitey" and "Barney." "Skippy," a terrier, earns a weekly salary running into three figures. "Whitey," a cow, has earned about \$12,000 in the past fifteen years. "Barney" is a sway-backed horse and gets \$35 a day when he works. They're all in the movies, three of the many animals you have seen working in the films. An article next month tells how the animals are trained for their roles before the camera.

#### Amateur Auto Races

HOW fast will it go? That's what every young driver wants to know when he has finished "hopping up" an old car. Out in California they find out—safely. Instead of chancing death on the highway, these drivers hold amateur racing meets—a sort of kindergarten for future speed kings. An article in the September issue tells about these amateur speed contests.

Published monthly by POPULAR MECHANICS CO., 200 East Ontario Street, Chicago, U. S. A. Single copy in United States, 25 cents; \$2.50 a year, \$4.00 for two years, \$5.00 for three years in United States and possessions, Canada, Newfoundland, Labrador and countries of the Pan-American Postal Union including Spain. To all other countries add \$1.00 a year extra for overseas postage. Changes in address must be reported to us immediately to climinate delay. Entered as Second Class Matter, Sept. 15, 1963, at the Post Office at Chicago, Illinois, under Act of March 3, 1879. Entered as Second Class Matter at the Post Office Department, Canada, Copyright 1938, by Popular Mechanics Co. in the United States, Australia and France.

#### RONNEY HOUSEHOLDER,

Daring Auto Race Pilot, Smashes All Time Qualifying Record For Indianapolis 500 Mile Race, Using Pyroil.

Blistering the track with a speed of 125.769 miles per hour for a distance of 25 murderous miles, Ronney Householder, daring West Coast auto speed ace, hung up an all time record in the qualifying time trials for the Indianapolis 500 mile race last May 30. Householder, a constant user of Pyroil, achieved his sensational record in the Pyroil treated, Thorne-Sparks Special race car pictured above.

On the Speedways of the world, you'll find Pyroil a favored stand-by of famous drivers. With it they build their cars, tune them, race them.

To improve the performance of your car—to safeguard its valves, pistons, cylinders, bearings, shafts; to reduce friction, wear; to eliminate and prevent carbon, gum, sludge and ruinous corrosion—use Pyroil every mile you drive! Ask your service station attendant for it, today. SEE COUPON BELOW. Manufactured and Guaranteed by Pyroil Company, W. V. Kidder, Founder, 58 Pyroil Bldg., La Crosse, Wisconsin, U.S.A.

# NOW READY! At your Willard Dealer's

# A NEW BATTERY THAT LASTS 68% LONGER

Get the Protection of This New Heavy Duty Willard that • • •

••• does all the things you've always wanted a battery to do—and keeps on doing them for 68% longer than the average of 178 other brands, including all the best known makes!

\* \* \* starts your motor over and over and over again—countless times—quickly—without fuss—and regardless of the weather!

\*\* \* takes the strain of hard, continuous driving — day after day — without flinching.

\* \* \* is a made-to-order power house to handle the extra demands of car radius, heaters, and other current-consuming devices.

This Willard "H-R" was developed after a 9-year study of 78,000 batteries driven over one billion miles. Its unusual performance is due to new developments in battery construction, exclusive with Willard. Most important single feature is a new type of Willard Thread Rubber Insulator that definitely increases battery life—and protects you against the sudden failures so often caused by "shorts" or buckled plates.

If you are one of the millions of car owners who will need a new battery this Fall, be sure to see the new "H-R". Its long life and low price mean true economy. Now on display at your Willard dealer's.

The WILLARD
HEAVY DUTY THEEAP EVENEY

7 OUTSTANDING FEATURES OF THE WILLARD "H-R"

- 1 Protected with the new-type Willard Thread Rubber Insulators that give the battery 68% longer life.
- 2 Reserve Capacity means longer life, plenty of power for radio or accessories.
- 3 Plates expertly designed, formed and processed to insure top performance.
- 4 Extra power for Winter starting-and superior resistance to summer heat.
- 5 Delivers high voltage to starter-saves gasoline, and oil dilution.
- 6 Handsome, new-style Hard-Rubber Container-tough and rugged.
- Written guarantee and adjustment policy, backed up by 42,000 Willard Dealers from coast to coast.

#### HERE'S WHY THE "H-R" WILL LAST 68% LONGER

No battery can last longer than its insulators. The positive and negative plates are like fighting roosters always trying to get at each other through the "fence" or insulator. If the plates wear a hole through an insulator and touch each other a "short" occurs and the battery goes dead immediately. This is the cause of many battery failures.

After years of research, Willard engineers have perfected a new insulator of cotton threads and latex. This new Thread Rubber is porous enough to permit fast chemical action between plates—yet tough enough to keep the plates apart until they wear out. Combined with Willard's superior plate construction these Thread Rubber Insulators give the "H-R" top performance and a life 68% above the average of competing batteries.

# "If I Could Only Recover Those Ten Lost Years!" [The True Experience of a Man Who Almost ]

In December, 1921, an American employed with a mining firm in Mexico, clipped and signed a LaSalle advertisement coupon. But he did not enroll!

Ten years of silence followed . . , ten years of hap-

hazard jobs, long hours, wretched pay . . .

Then, in January, nineteen thirty two, that silence was broken by a dramatic letter, high-spotted by these words: "Please send the first lessons with the least possible delay, as time is a highly important factor to me in this year of our Lord!"

Through five typewritten pages he recounted the hardships of those intervening years. A really able man, he had moved from one position to another, only to find advancement closed to him for lack of specialized

training.

No need here to recite those hardships—though in justice to him it is only fair to say that on four separate occasions he had almost enrolled . . . and that on each occasion he had postponed action because of some unexpected reverse seemingly beyond his power to avoid.

"For five months now," so he wrote, "I have been on vacation.' Not a chance to take a course now—according to my carefully laid out and conscientiously

followed program . .

"But—supposing I had chucked that program at any time in the last 10 years? Supposing I had enrolled, in the face of seeming disaster, even though I had had to borrow the money to do it? Supposing even that I had enrolled only five months ago, at the beginning of my enforced vacation? In all likelihood I could have mastered the training by now. Or I might in the meanwhile have found a congenial and profitable position, thanks

to my increased knowledge. As it is, for all I know, there may be another five months without any position ... with all sorts of dim prospects... and meanwhile I am setting older.

am getting older . . .
"That settles it! To blazes with further procrastination!
To thunderation with my financial program! I've borrowed the money, and I'll borrow some more . . . but I'll do something with my time! This year is going to see a big change in my affairs—and right here is where we start!"

#### Send for Free Booklet

These are searching times—and wise is the man who takes full measure of his competition... gets the special training that he needs... and thus commands the unfolding opportunities of our new-day business world.

If you need to be convinced of those opportunities, forget that you ever read this message. For those oppor-

tunities are not for you . . .

But if you are determined to be out in front when men are picked for leadership one year, two years, ten years from now—do not, on your life, risk a day's delay.

Below is a coupon. It will bring you—without cost—books that have led to increased earnings running into many thousands of dollars! Men of action—hundreds of them—will use this coupon for their personal advance-

# Anchoring CONCRET

Tight anchoring in concrete or tile-one of your worst puzzles is easy with Smooth-On No. 1,

For light service, as in attaching bath-room fixtures (Fig. 1), hooks, etc., drill slightly oversize holes, fill with a soft putty of Smooth-On No. 1, set screws in this soft cement and turn up tight.

To anchor a railing post (Fig. 2), make a hole large enough to insert end of post, and tamp the space surrounding the end of post full of Smooth-On No. 1.

To anchor bolts in a concrete wall, make the hole large enough to clear the bolt head and of proper depth. Insert the bolt head and fill around bolt with Smooth-On No. 1. Large bolts can be set in Smooth-On No. 7. Tamping the cement into place gives a tighter hold. When the cement is hard, the bolt is ready for service.

Lag screws are held by making the hole just large enough in diameter to clear the screw. Put a soft putty of Smooth-On No. 1 into the hole, insert lag screw and turn it up into place.

In all of the above applications, the slight expansion of Smooth-On No. I in hardening gives a very strong hold of bolt, screw or post.

Use Smooth-On No. 1 in the home also for tightening loose parts and stopping leakage of water, steam or gas.

Doing this work in accordance with instructions and diagrams in

the Smooth-On Home and Auto Repair Booklet enables any home mechanic to get perfect results and effect big annual savings. Mail the coupon for your copy.

# Enjoy a Real Job in Industry

#### Steady Work

As nearly all manufacturing—construction—building starts on the drafting table, the draftsman is one of the first to be hired and one of the last to be laid off. It is his blueprints, his specifications, that give the last word in what the workmen are to do. No article—building or construction job is started before the plans drawn by the draftsman have been officially approved.

#### **Good Pay**

The draftsman has been called the Junior Engineer which title just about describes his work—position and pay. He combines his knowledge of principles, mechanism and construction details with the ability to draw and reproduce motions and methods on paper. On the average, his salary is considerably above the wages of the mechanic and, of course, less than that of the engineer.

#### **Chance for Promotion**

Working on plans, helping design new machines or new methods of construction, the draftsman is working directly with the important men of the organization. Consequertly he knows what is being considered and planned. It may be the superintendent—the engineer—or even the prospective buyer with whom he consults. Because of these contacts, his experience and knowledge of the business in general he is in an excellent position to be promoted when next there is a good opening.

#### Young at 40

Athletes—farmers—and factory and shop workers who rely on muscle start growing old even before they reach 40 while office workers—executives—teachers—professional men, in fact, all kinds of brain-workers are just approaching their prime at 40 to 50. Training increases your value at once and continues to help boost your earning power as you mature.

#### Don't Be Just Average

What happens to the average man? Not having thorough training for a worth-while job, he goes along year after year, wishing he had a good job, but wishing was never a substitute for training. \$40 a week is about his top, usually never that high. Grows old on the job, starts down at 40, finds himself slipping in speed and salary.

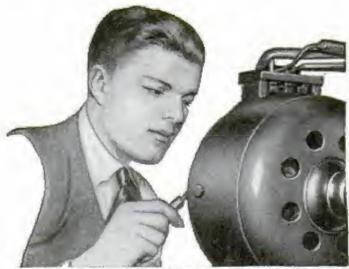

But the ABOVE AVERAGE MAN loses no time getting his training. Prepared for the job ahead, he is in line for RAPID PROGRESS—his WORK STEADY, his PAY GOOD. Trained, a young executive, young Draftsman drawing plans for great projects. YOUNG ON THE JOB at 40, at 45, at 50! And still has 10 or 15 years active service at good pay to which he can look forward! Training—the sooner you get it—the sooner it can help LIFT YOU ABOVE THE AVERAGE!

Don't grow old at 40. Train now for the job you want at 50. Training helps you to be independent—self-supporting. It helps you to enjoy associations that are denied the untrained man. Training helps you to increase your earning power and by so doing to offer members of your family advantages far in excess of what you could give them as an untrained man. Train and enjoy PROGRESS—CONTENTMENT—INDEPENDENCE.

## .. and Where There Are Diesels You Find H. D. S. Graduates

Almost every day . . . right in your own daily life . . . you see Diesels at work . . . read about, or hear about, this great new form of power . . . about how it is spreading like wildfire. Hemphill Schools graduates are in the thick of this great swing to Diesel. Back of thousands of Diesel horsepower turning the wheels, driving the propellers . . . meeting the world's numerous power needs . . , are Hemphill men, in the many interesting, "big future" jobs offered by Diesel.

H. D. S. graduates are operators, chief engineers, sales engineers, superintendents, service men, master mechanics . . . 10 name only a few of the types of positions. They qualified for their jobs and opportunities the proven Hemphill way . . . through practical training that you, too, can obtain at any one of the Hemphill Diesel Schools you may prefer to attend. Or you can start your training at home . . . now. For complete information on Hemphill Diesel courses, send the coupon today.

Present Position

If you reside in Canada, send this compon to the Internation
Correspondence Schools Canadian, Limited, Mantreal, Canada

DESIGNED to serve two purposes, a convertible table settee has been pat-

ented. The piece of furniture may be changed from a settee into a table simply by swinging the backboard upward and forward. It is provided with a small wheel on each side

at the rear to facilitate moving it around the room. Furniture of this type would find many uses in the small home or apartment.

HOME workshop operators, plumbers and others would find useful a pat-

ented pipe-joint welding clamp. The clamp provides for gripping two pieces of pipe firmly in position for welding. The pipes are held in a trough by two clamps. Once the

pipes are made secure, the worker is free to operate his welding outfit.

ENABLING blind persons to write script, a line guide has been patented.

It consists of a frame with two members adapted to extend along opposite edges of the writing paper and a number of strands of resilient material which connect these guiding members. The strands are sufficiently close to the paper to flexibly guide a pencil in the hand of a person writing on the device.

INTENDED to provide more comfort for the automobile driver in winter, a lap

robe which permits operation of gear shift and brake levers has been patented. The robe is secured at its forward margin to the instrument panel. In use, it

extends over the driver's lap to exclude chilling drafts. At other times, its rear margin may be buttoned to the instrument panel, the robe folding to form a sort of bight. The levers may be operated when the robe is in this inactive position.

I NCREASED comfort for the bicycle rider is one purpose of a spring-like frame

patented recently. The frame has a tubular spring rear fork curving downward and rearward to a short forward bend forming resilient loops. Wheel supporting

members are secured to the forward ends of the resilient loops. A lower tubular spring rear fork has its rear ends connected to the wheel supports. Springiness of this bicycle frame is said to result in absorption of many road shocks ordinarily

# WHAT OUR PATENT SERVICE DOES

THE first important step in securing a patent is to obtain the services of a Registered Patent Attorney. The U.S. Patent Office advises that you secure the aid of a Registered Patent Attorney to prepare your application and counsel you.

We have secured patents for inventors located in every state in the Union. Our organization is a large and efficient one. Our practice is confined entirely to Patents. Trade-Marks, and Copyrights. We have had years of experience in Patent Matters. When you place your invention in our hands, we are in position to proceed at once to secure protection for you.

Don't worry about finances. Our fees are very reasonable—we can arrange convenient terms of payment. It is our custom to permit clients to pay for our services in installments as the application progresses in our office.

who are making a good living from inventions. If you have inventive originality and the ability to recognize human needs, you should go far in the commercial world. If you are considering Invention as a career, write for our FREE BOOK at once.

#### IF YOU HAVE A ME-CHANICAL INVENTION

There is probably a bigger demand for mechanical inventions today than any other type. If your invention is of a mechanical nature, the first step is to have a search made at the U. S. Patent Office to ascertain that no one has gotten ahead of you. You will find this FIRST STEP fully covered in our FREE BOOK, "Patent Guide for the Inventor.'

#### THE ANSWER TO YOUR QUESTION "HAVE I A SALEABLE INVENTION?"

Some of the most successful commercial inventors men who amassed large fortunes-reaped their rewards on simple everyday creations; the kind of things that make thousands ask themselves the question: "why didn't I think of that myself?" If you can beat the other fellow to the little gadgets always cropping up that make life more comfortable, easier, or exciting, you may succeed as a successful inventor. Are you convinced that you have "something?" Then don't flounder around trying to make up your mind to start; ascertain right now if you have hit upon an original idea by having us institute a Search of the U.S. Patent Office Records to determine if your invention has been anticipated.

#### IMPORTANCE OF ACTION

The greatest curse of the average inventor is delay in making practical use of his invention. The day-dreaming inventor may have wonderful ideas but unless he gets a Patent on his invention he is likely to remain a dreamer all his life.

Your invention of a practical article or an improvement upon an old one should be patented NOW. Frequently many of the thousands of applications filed in the U.S. Patent Office each year are for the same or almost the same invention. In such case, the burden of proof rests with the last applicant to file. Sometimes a delay of even a few days in filing the application means the total loss of the patent. LOSE NO TIME,

# **NOW ANYONE CAN LEARN** TO PLAY MUSIC THIS QUICK EASY WAY

New simplified home-study method ends gambling and guess-work-over 700,000 students.

Fraction of the cost of old way methods

IT'S surprising to discover how many folks have learned to play music this new, quick, easy way—people who you imagined had practiced for years and spent huge sums on personal teachers' fees. Yet up to a short time ago they were in the same position as you are today.

You, too, can learn to play real music. And you won't need a private teacher, either. You'll learn all by yourself—right in your own home. And best of all the cost is only a small fraction of what it used to cost by old-fashioned methods.

More than 700,000 have studied this U. S. School of Music way. It is easy as A-B-C. No special talent is required—no previous musical training. You learn to play from real notes—the same as those used by accomplished musicians. The best part of it all is that it is so simple—so crystal elear—so easy to understand. It's

LEARN TO PLAY BY NOTE Piano Guitar Violin Saxophone Organ Mandelin Tenor Banio Hawalian Guitar Piano Accordion Or Any Other

#### NEW INVENTIONS

\$ 598 (Continued from page 20A)

transmitted to the rider. The front fork also is curved, adding to the streamline appearance of the bike,

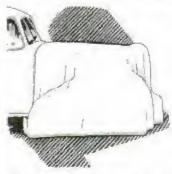

MORE secure fastening of heels to women's shoes is provided by a method

patented recently. The heel literally is bolted to the shoe by means of a screw and a threaded connector. The work can be accomplished with two small machines. The

method prevents the heel from becoming loose and from breaking off. Weight of the shoe with its heel attached by this method is slightly less than that of shoes manufactured in the ordinary manner.

PROTECTION for the automobile hood, fenders and engine is afforded by a

cover patented recently. The cover is made to fit closely around the front of the car and down over the fenders and wheels. Thus, a complete, snug housing for the

front end is provided. The cover is especially useful on camping trips or tours where the car cannot be kept in a garage at night, and in bad weather.

ATEST of lamps made with novelty burners is one with a design repre-

senting a volcano in eruption. The burner, made to fit an ordinary lamp, is in the shape of Mount Pelee. It has an arrangement of indentations against or through

which the flame of the burning lamp glows to represent streams of lava pouring from the black volcano. The base shows a city

## Go to High School at Home

You can secure a high school education in your spare time by studying the new courses prepared by the International Correspondence Schools.

These courses are equivalent to the courses given in resident high schools. They have been specially arranged for men and women who wish to meet college entrance examinations, to qualify for a business position, or to make up the education they missed in past years.

The lessons are easy to understand and you will make rapid progress because you will be in a class by yourself and you will study under the guidance of instructors who are sincerely interested in you.

Just mark and mail the coupon and we will gladly send you interesting free booklets describing the High School Courses of the I. C. S. or any other subject in which you are interested.

Advertisements in this section, 35 cents per word, each insertion, minimum 10 words, payable in advance.

To be inserted under proper classification in September issue, copy should be in our office July 8th.

September issue on sale August 1st.

Popular Mechanics Magazine, 200 East Ontario Street, Chicago, Illinois

### YOU'LL PROFIT

By reading and answering the classified ads in this section. Hundreds of opportunities to make and save money.

Mr. F. W. Johnson,

Popular Mechanics Magazine,

200 E. Ontario St., Chicago, Ill.

Dear Mr. Johnson: It is very hard to believe or convince anyone that a musical instrument ad would draw better in the Classified section of Popular Mechanics Magazine than it does in music magazines, but it's the truth. However! Since I have been advertising in the classified, reading it more carefully I can plainly see that this classified section is a wonderful buying guide for most anything, and with a tremendous circulation, an ad is bound to pull.

## SNUBBED BECAUSE OF ADOLESCENT SKIN"?

Act now to help keep your blood free of pimple-making poisons

Don't go on being cursed by loathsome pimples. Don't make others feel ashamed of you or shun you. Find out what's the matter and correct it.

During the period of adolescence, in the years be-tween 13 and 25, important glands are developing. This causes disturbances throughout your body. Waste poisons from the intestines often find their way into the blood . . . and may break out in ugly skin eruptions. You must help free your system of these intestinal poisons.

Thousands of young people have solved this problem—simply by eating Fleischmann's Yeast. Each cake of this fresh food contains millions of tiny, living plants that act to help you eliminate waste poisons from the body—before they can get into the blood. Your skin becomes clearer and fresher again. Many get remarkable results in 30 days or less. Don't lose time. Start eating Fleischmann's Yeast now . . . 3 cakes daily, one before each meal.

the comb, are provided for the flow from tube to the user's head.

A N attractive addition to the library or "den" in the home would be an illu-

minated terrestrial globe which has just been patented. The globe, which is translucent, has an opening for receiving an electrical socket into which is screwed a light

bulb. The socket forms one bearing point on which the globe may be rotated when desired. An annular ring is attached to the globe at the location of the equator.

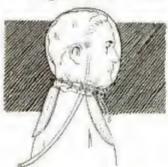

SERVING the two purposes of clothes hanger and brushing rack, a handy

device for the home has been patented. It has parts for engaging the shoulders of coats and means for pivotally supporting the hanger on a vertical surface and for swing-

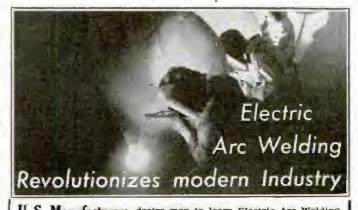

ing it from horizontal into vertical position. In position for brushing, the device affords protection against wrinkling of clothes.

F<sup>OR</sup> making underwater observations or explorations in comparatively shallow

water, a diving hood has been patented recently. It consists of a dome-shaped flexible head-encasing member, the lower end of which extends down around the neck. The neck

portion may be drawn closely about the neck by means of a cord so that air spaces may be eliminated from all portions of the hood except at the front, adjacent to the nose and mouth. An air hose or tube supplies air in the usual manner. Air pressure keeps water from entering.

U. S. Manufacturers desire men to learn Electric Arc Welding production conditions in the laboratories of the School of Engineering. Moderate training Fee. Accepted applicants will be fully trained until ready to pass rigid test and assisted in securing employment.

ARC presents one of the outstanding opportunities for steady income and tuture success. Welding is growing rapidly, replacing large and intricate castings, rivets, nuts, botts, screws. It is commonly used in assembling cranes, hotsts, bridges structural steel work, etc. No limit to the application of welding to industry, increasing durability and reducing manufacturing costs. There is a decided shortage of properly trained Welding Operators, Technicians, and Welding Engineers. Why he cuntent with ordinary work, hit and miss jobs and low pay when in a short time you can become a trained Specialist in Welding?

# The DIESEL in the AIR

The "Nordmeer" waiting to be hoisted on board catapult ship after transatlantic crossing.

This seaplane is equipped with four 600-horsepower Diesel engines -, f

MANY Diesel-engined planes are now in use in Europe and their

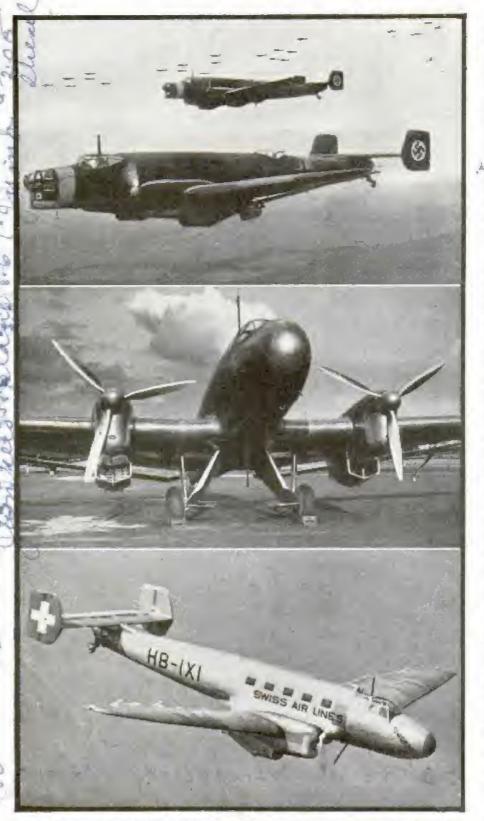

number is rapidly increasing every year. This change-over from the gasoline engine started in 1931, when a plane equipped with a Junkers Diesel was tried out by Deutsche Lufthansa, Germany's national air line. That year, only 1,634 miles were flown, but from that small beginning, Diesel mileage has increased steadily. Last year, at least 25,000 miles a week were flown with Diesel-engined craft and this

By Paul H. Wilkinson
Author of "Diesel Aircraft Engines"

the mileage will be near the 50,000-mile-a-week

mark. The engine making these flights possible is the Junkers "Jumo" Diesel. Development work commenced as far back as 1912, so many years elapsed before success was attained. Now, the importance of the Diesel can be judged from the fact that a huge new factory near Dessau has been built to produce these "Jumo" power plants. The current production model is the "Jumo" 205, which has power ratings

Thurson Tribune 5/8/38

Top, Junkers Ju 86 K fighter-bombers are Diesel powered. Center, German air liner powered with water-cooled Diesel engines. Bottom, air liner in Swiss Air service is driven by Diesels

ranging from about 600 to 700 horsepower.

Deutsche Lufthansa uses Diesel-engined planes on many of its routes in Germany, and on routes to Holland, Switzerland, Poland and Denmark. Swiss Air, too, employs the Diesel on its air lines between Zurich and Vienna. The plane in which the engine is most extensively used is a

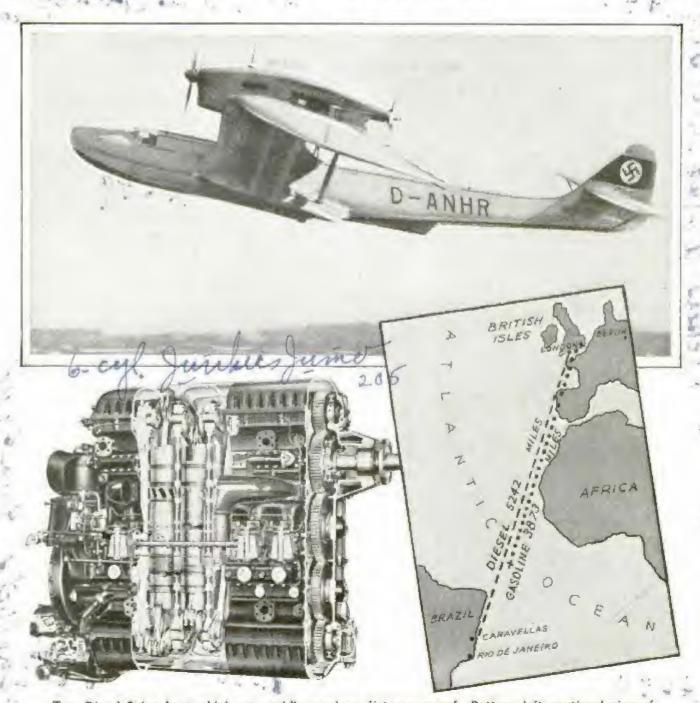

product of the same concern which builds the engines. This is the Junkers Ju 86, a modern all-metal, ten-passenger air liner similar in appearance to the twin-engined Lockheed in this country. Powered with two 600-horsepower "Jumo" 205 Diesels, it cruises at 175 miles per hour and has a range of about 1,000 miles.

Versatility of the engines on these planes was demonstrated a short time ago when one of them visited Kabul, in Afghanistan. In that remote region, Diesel fuel was unobtainable but there was plenty of kerosene available, so the plane was tanked up and continued on its way, 950 miles to its next port of call, without difficulty.

The "Jumo" Diesel is also utilized for military purposes. The military version of this plane is the Ju 86 fighter-bomber extensively used by the German Air Corps. These planes have special turbo-supercharged engines which develop their rated power of 700 horsepower at an altitude of 20,000 feet. Many squadrons of these bombers are in service, and the engine is being tried out on other types of fighting craft.

On air-mail routes, the Diesel has some fine flights to its credit. Outstanding was the 3,600-

mile non-stop flight of a Junkers Ju 86 mailplane with its crew of three from the factory at Dessau, to Bathurst in British Gambia, on the west coast of Africa. This flight was first accomplished in 1936, at an average speed of 180 miles per hour. Since then, it has been repeated frequently. The maximum range of these planes, carrying

Top, Diesel flying boat which set world's scaplane distance record. Bottom, left, sectional view of aviation Diesel. Right, map shows distances that two similar planes of equal fuel capacity would travel if one were equipped with Diesel engines and the other with gasoline engines. The Diesel gives about one-fourth more miles per gallon under average flying conditions

1,000 pounds of mail, is about 4,000 miles. From Bathurst, Deutsche Lufthansa operates a fleet of four Dornier Do 18 flying boats across the 1,900-mile stretch of the South Atlantic to Natal, in Brazil. These planes are named the "Acolus," the "Zephir," the "Pampero" and the "Zyklon." Their engine installation is noteworthy in that it consists of two 600-horsepower "Jumo" 205 Diesels mounted in tandem, back to back, along the axis of the plane. This makes possible excellent streamlining of the engine nacelle, and as the propellers then revolve in opposite directions, their torque is neutralized. The Do 18 carries a

crew of four, has a cruising speed of 125 miles per hour, and can carry a 1,000-pound payload a distance of 2,400 miles.

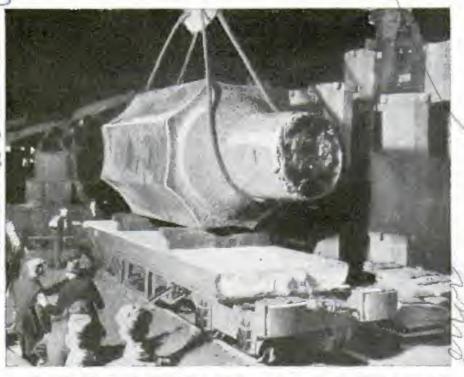

The "Aeolus" and the "Zephir" will be remembered for their survey flights across the North Atlantic in 1936, when they made eight scheduled flights between New York and the Azores. So well did their engines perform over the 2,400 miles between these points, that two larger planes with similar power plants were ordered by Deutsche Lufthansa for their 1937 flights. These powerful Hamburg Ha 139 seaplanes, the "Nordmeer" and the "Nord-

POPULAR MECHANICS

## Steel Ingot Weighing 230 Tons Is Produced in English Plant

Loading the big chunk of steel on a flatcar. It required a 250-ton crane to manipulate the 230-ton ingot, largest ever produced in England

Destined to be made into large forgings for use in the British re-armament program, a 230-ton steel ingot turned out recently by a plant at Sheffield set a new record for England, if not the world. It measured twenty-five feet by eight feet nine inches, and required steel from four acid open-hearth furnaces. A 250-ton crane set it on a railroad truck.

## Chemists Convert Waste Lignin into Valued Raw Material

Once a waste product of the forests, lignin at last is being converted by chemists into highly valuable raw materials. In the U. S. Forest Products Laboratory at Madison, Wis., ways have been found to make lignin into wood alcohol; into propyl-cyclohexanol, which may be used as a lacquer solvent or a wood preservative into an adhesive resin which promises to become a valuable plastic material, and into other compounds for the chemical and lacquer industries. The method of conversion is hydrogenation, used previously to obtain petroleum oils from coal. Lignin comprises twenty to thirty per cent

of the stems of trees and woody plants, and more than seventy per cent of it can be converted into chemicals for industrial use. One source already available is the 1,500,000 tons of lignin discarded every year by factories.

## Wigwag Headlight Used as Passing Signal for Auto

Swinging from side to side to command attention, a wigwag headlight for private automobiles is used as a passing signal to the car ahead. It is the type of light used by fire and police cars and some high-speed railroad trains, but on the private car it is a white light, mounted on the front bumper bracket and fo-

cused below the eye level to avoid dazzling. When passing a car, rounding a curve or meeting a driver whose lights are out of order it is an effective warning. Touching a button on the floor causes reflector and light bulb to move; all operating parts are scaled against dirt and moisture

Button on floor of car sets bulb and reflector in sidewise motion, lens and housing remaining still

Wireless Box Runs Radio by Remote Control

A radio receiver in the living room may be operated from the kitchen, a bedroom or any other part of the home with the aid of a small remote-control cabinet which has no wires leading to the receiver or any other physical connection with it. Since it is unnecessary to "plug in" the portable control unit or to attach it to the receiver, it is as easy to play the radio while sitting on the front porch as when in the living room beside it. With the aid of the wireless box, a Philco receiver designed for this form of remote control can be operated from a distance or tuned with controls built in the cabinet, whichever is handier. With the remote-control unit, any one of several stations can be selected, a change can be made from one station to another, volume can be adjusted or the set can be turned off, simply by operating a dial in

the top of the wireless box. The makers claim each unit will operate only the set for which it is designed. While this is the first time wireless remote control has been applied to a commercial radio receiver, a tractor was operated by radio at Chicago's Century of Progress and wireless units have also been employed to control model boats, automobiles and airplanes. In the latter cases, the remote-control units usually consist of battery-

The radio receiver, above, can be operated from any room in the home with the aid of the remote-control box which is not connected by wires or in any other physical way with the receiver

operated radio oscillators transmitting high-frequency impulses. These controlling impulses actuate relays which operate the mechanism in the yarious devices.

## Soilless Farm Yields Vegetables for Wake Island Colony

Passengers and crew of the trans-Pacific "Clipper" planes and the maintenance force on Wake Island dine there on fresh vegetables produced on the island's soilless farm. In ten days recently the shallow, water-filled trays yielded thirty-three pounds of tomatoes, twenty pounds of lettuce, twenty pounds of string beans, fifteen pounds of squash and forty-four pounds of corn. Lacking soil but favored by tropical weather, Wake Island was found to be an ideal place for hydroponic farming, in which essential minerals in water take the place of soil.

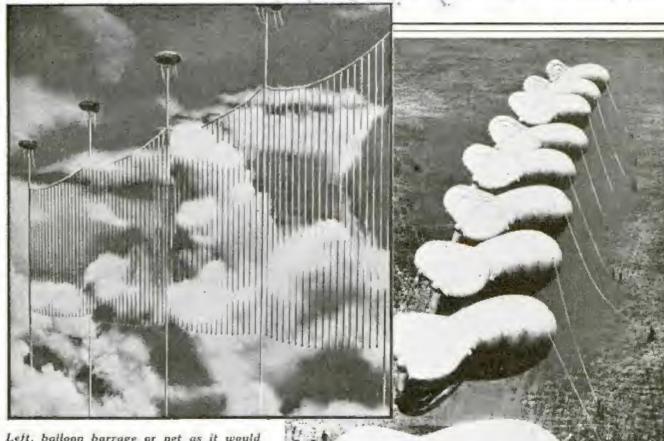

and Bras 105

## It's Time for Canning in the Tennis Factories

owaiting the proper moment for being covered

## Anti-Air Raid Net Is Supported by Balloons

Left, balloon barrage or net as it would appear in use. Right, ground crew raising the captive balloons

Enemy planes attacking London will be entangled like flies in a spiderweb by an anti-air raid net which will be supported by captive balloons. If the planes rise to avoid the net, they will be flying too high to drop bombs with any degree of accuracy, yet will still be within range of anti-aircraft guns. Squadrons to handle the defense net will have forty to fifty

captive balloons which will be inflated at the first warning that raiders are on the way. Personnel of the squadrons will be trained for the work, of inflating and getting the balloons into the air quickly. The balloon net already has been demonstrated to the satisfaction of Great Britain's military authorities.

## Washing Machine Motor Drives Midget Racing Auto

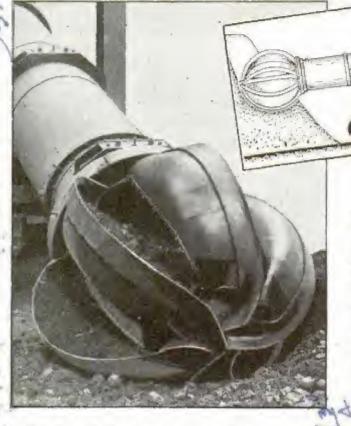

Missouri boy at wheel of ope-cylinder midget car

Built on racing lines, a midget automobile constructed by Grover Revelle of Fredericktown, Mo., for his younger brother is powered by a one-cylinder washingmachine motor. Its "radiator" is copied after the latest style die-cast grilles. The tiny car will travel fifteen miles an hour on the level, and runs fifty to sixty miles on a gallon of gasoline

## Ball-Shaped Rotary Shovel Speeds Up Work

Designed for excavating loose ground and simultaneously dumping the soil into trucks, a rotary ball-shaped shovel has

Top and bottom, the ball-shaped shavel at work. Inset, sketch of the machine

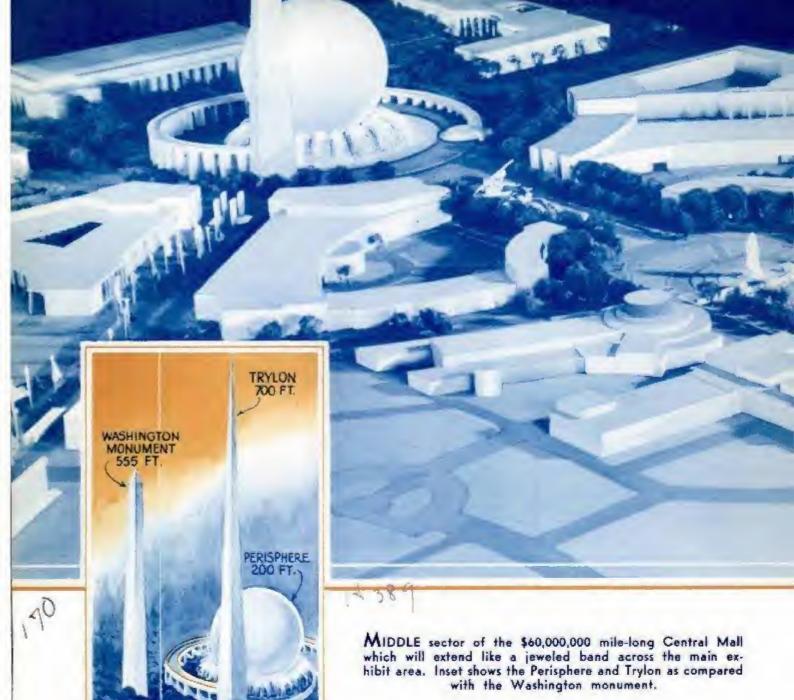

six scoops which are operated much like a bucket-dredger. The earth falls from the scoops as they approach their uppermost position and rests on inclined plates, mounted on the stationary portion of the head. These plates guide the material onto a conveyor belt that runs inside the tubus lar backbone of the machine. The rotating part of the shovel head is driven by a six horsepower motor.

### Electron-Ray Supermicroscope Magnifies 100,000 Times

The head magnifications. The instrument uses elecof the shovel has a rotating ring fitted with tren rays instead of ordinary light rays.

NIGHT view of the Perisphere at the New York World's Fair of 1939, as conceived by an artist. Moving patterns of colored light on the ball will cause it to appear to turn.

MERICA'S largest city next year will stage the world's largest fair, a \$150,000,000 exposition costing about three times as much as Chicago's famed Century of Progress.

In addition to costing three times as much, the New York fair will be three times as big as the Chicago fair. The Century of Progress covered 424 acres. The New York World's Fair of 1939 will

extend over 1,216 acres.

In fact, New Yorkers point out happily, if Chicago's Columbian Exposition and Century of Progress were combined, both of them together would not be as large in area or as costly as the fair New York is planning. And whereas the Century of Progress attracted about 38,650,-000 visitors in two seasons, New York expects to entertain 50,000,000 visitors in six months.

Building the world of tomorrow will be the New York fair's central theme and when it opens next April 30, just 150 years after the inauguration of George Washington in New York City as our first president, it will present an example of man-made magic as amazing as the blooming of a lily out of the mire. For Flushing Meadow Park, the exposition site on Long Island, was formerly a city dump and this fair is rising out of a mountain of ashes to demonstrate how the tools and processes and knowledge of today can be used to create a better world tomorrow.

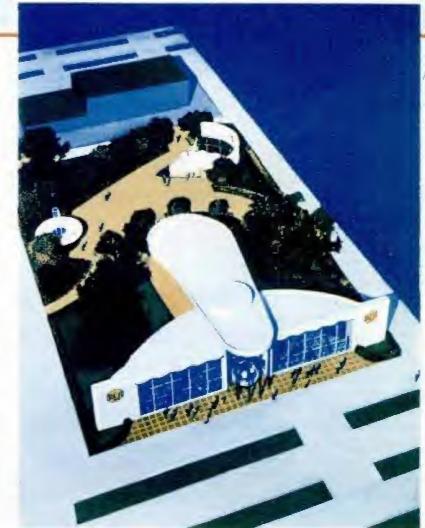

The theme center of the exposition and the dominant architectural feature is to

TELEVISION programs will be featured in the RCA building, shaped like a radio tube, shown in model form at right. In circle, model of a fifty-foot sundial.

be a white globe 200 feet high seemingly poised on a cluster of fountains and flanked by a 700-foot triangular shaft. This great white ball, called the Perisphere, will rise eighteen stories above the ground and will be broader than a city block. Except for the tower, it will be the fair's highest structure and will house the key exhibit, a spectacular portrayal of the world of tomorrow.

An endless stream of humanity will flow into the Perisphere night and day by way of a glass-enclosed moving stairway, the world's longest. From the top of this flight, five stories above the ground, visitors will step on a "magic carpet" or circular moving platform for their journey into the world of the future.

As this platform, fourteen feet wide, 450 feet in circumference and carrying 1,200 passengers, moves slowly around the sphere, the crowds will gaze down on a vast panorama showing cities and towns, factories and farms and fields stretching off to the horizon on all sides and blending into the clouds and light patterns of the dome.

Here will be shown all the elements of society linked together for the common good. Ships and trains and trucks will be observed bringing raw materials from farms and fields to cities and factories, and carrying manufactured products back to the country. A voice will explain the significance of all this movement, stressing the fact that each person today is dependent for his existence on the efforts of many other persons and pointing out how the problems of living have been simplified by cooperation.

From the exit, visitors will cross a bridge linking Perisphere and tower, descending a stairway inside the shaft or walking down a 900-foot "helicline" or

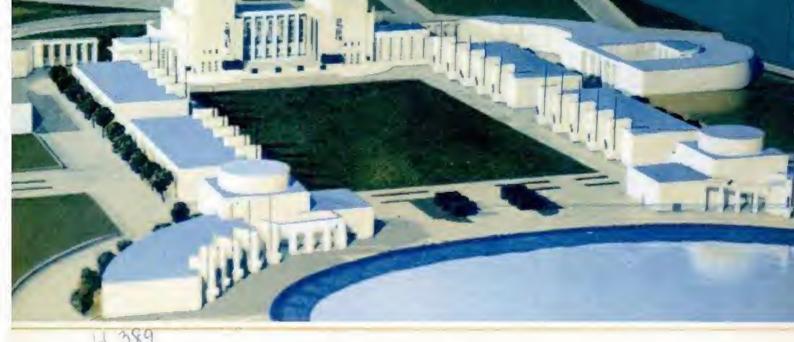

NIGHT scene along the Central Mall as conceived by an artist. Mercury vapor lights, sunk in the ground, will cast a glow into the trees, causing the under sides of the leaves to fluoresce and bathe the entire area in a luminous radiance after dark.

ramp winding around the fountain basin beneath the sphere. The top of this helicline, fifty feet above the ground, will be the highest point to which visitors will be admitted and will command a view of the entire fair.

Spectacular illumination will make the globe an awe-inspiring sight at night. Batteries of projectors will spot the sphere in color and other projectors will superimpose moving patterns of light on the ball, creating the illusion that it is a glowing, almost transparent bubble of changing color rotating lazily atop supporting clusters of spouting fountains.

Actually, the Perisphere, of articulated steel frame construction with a light outer covering and weighing more than

COURT of Peace, above, with the imposing federal building at one end of vast parade ground.

Below, artist's sketch of seventy-foot entrance facade of Hall of Communications.

9,000,000 pounds, will be supported on eight sturdy columns but spectators will not see them because they will be encased in glass and water will be pumped up around them, making it appear that the bubble is held up by the rush of water.

The shaft, christened the Trylon, half again as tall as the Washington monument, will have a triangular base of sixty-three feet on each side and will serve as a fair guidepost since it will be visible for miles. It also will be a steel frame with a light covering and, while it has not been planned to use it for observation purposes, there will be space of for installing elevators.

The Trylon is not to be illuminated at

night, except for reflected light, but will serve as the source of fair broadcasts. From it the "voice of the fair" will issue announcements over a new type of long range sound projector which will make it possible to blanket the entire grounds with beams of sound, thus eliminating overlapping and unpleasant variations in volume.

Water, flame, color and sound in almost incredible proportions are to be combined in providing two nightly spectacles expected to rival in sheer size and grandeur anything ever conceived by man for entertainment alone. One spectacle will feature the play of superfountains and super-flames, synchronized with color effects, music and sound.

The other will be a manmade Niagara plus a manmade Vesuvius, an approach to chaos.

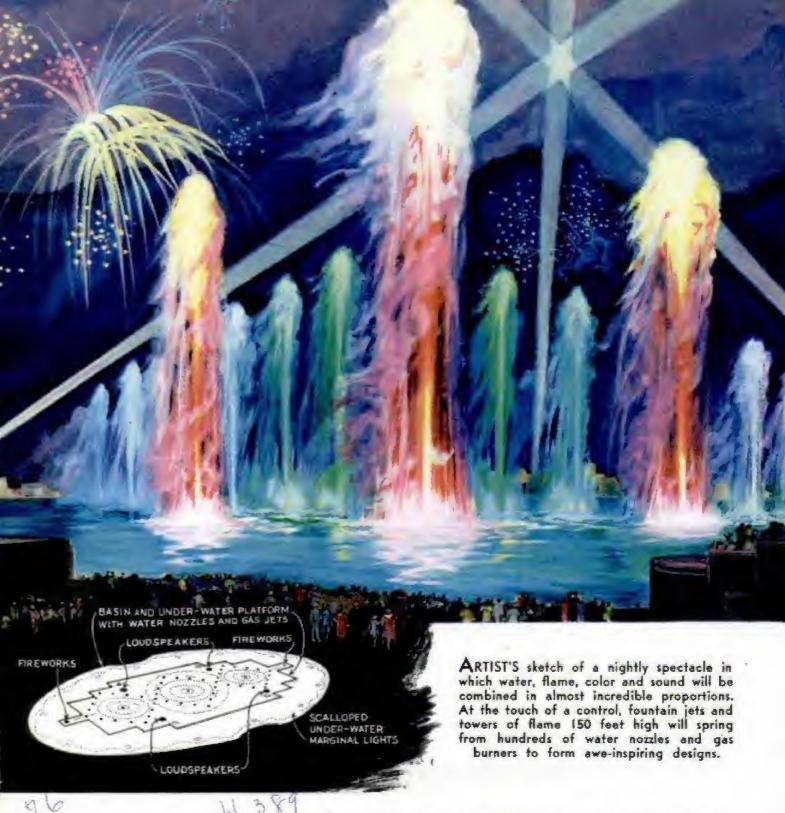

Hydraulic engineers, gascompany chemists, fireworks manufacturers, illumination experts, musicians, display engineers, architects, color specialists and artists collaborated in planning these two displays which require installations costing \$700,000 and which are on so large a scale that two gas companies have united their resources to assure enough fuel.

The controls for these spectacles have been planned so carefully that a composition in water, flame, color and sound can be "played" from a central

MARINE amphitheater and island stage, top, which the State of New York will erect and where great pageants and spectacles will be presented. Above, model of the \$250,000 Aviation building. Below, twin ship prows, each eighty feet high, will give a nautical touch to the main entrance of the Hall of Marine Transportation.

board much as one would render some great work on a pipe organ. At the touch of one control, a thousand fountain jets, some 150 feet high, can be made to spring from invisible sources, or towers of flame equally high can be produced to combine with the uprushing water in a furious battle of the two elements.

Then, at the height of this display, all valves can be closed so quickly that fifty tons of water will seem to hang suspended in midair. The apparent color of the water and the actual color of the fire can be controlled as easily, and the strains of a violin or music as tremen-

dous as thunder can be produced from the very heart of the spectacular turmoil.

One spectacle will be presented from an 800-foot lagoon in the main exhibit area, the other from a lake in the amusement zone. The lagoon display will require 1,000 water nozzles and many twenty-four-inch gas burners of the Bunsen type. Water nozzles will be grouped to produce the 150-foot columns, and one circle of jets which will produce a sheaf of golden wheat ninety feet high will require as much pumping force as would be exerted by sixty-two fire pumpers.

For the lagoon display, the many circles and pat- (Continued to page 128-A)

## Stagecoach and Sky Liner Weld a Continent

Western stage coach and a 1938 style air liner "take off" side by side, dramatizing the conquest of a continent by transportation. There is less than a century separating the horse-drawn coach from the flagship

It was only a half century from stagecoach to sky liner! A half century that moved swiftly, as pony express, stagecoach, railroad, motor road and finally the airplane brought city closer to city, until today the mail and passenger planes span the continent in less than a day. The parts that stage and air liner have played in welding the nation were remembered dramatically the other day when an old-time western coach rattled along a highway while a giant flagship rose beside it.

## Vacuum Tubes and Alloys Bring Back the Harpsichord

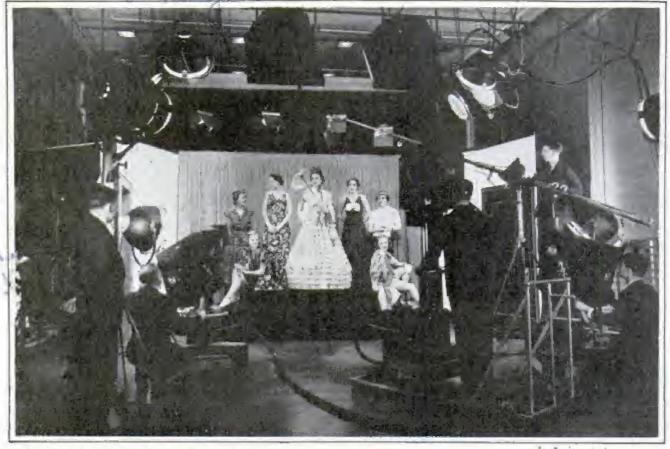

Scarcely more than a museum piece since the piano sent it into eclipse, the harpsichord is coming back. Vacuum-tube

amplifiers, twentieth-century mechanics and hard metals have overcome the handicaps of the instrument that almost disap-

Playing the electric harpsichord, which has tone control and amplification impossible in the original instrument

peared after dominating the musical world for several hundred years. Piano strings are vibrated by a hammer blow, and the strength of the sound is varied by the strength of 'the finger blow. The harpsichord strings are plucked. The electric model has nickel-silver picks with long wearing qualities; tone control at the fingertips like the piano, and amplification. Instead of the string vibration being transferred to the sounding board of the instrument, the vibration simply varies an electrical current in a magnetic field and sets up an electrical copy of the mechanical vibration. By means of a tone-color control the shape of the electrical pattern can be changed and thus change the timbre of the tene produced.

Scene in NBC experimental television studio in RCA building, New York, during a television fashion parade. Eighty-seven programs were telecast by NBC last year

TEN years ago a woman sat under blinding lights in John L. Baird's television studio in London while a group of men, assembled around a receiver in Hartsdale, N. Y., saw her face on a screen.

That radio transmission of a moving picture across 3,000 miles of ocean led many to believe that television, a new Twentieth-century wonder, was about to round the corner and, like radio, enter most American homes. But years passed and nothing of this sort happened. People still are asking, "When will we have television?"

There are three different answers to this question, all of them true. We have television right now—as a laboratory accomplishment. We have it also in the home—but it is limited to the homes of a few experimenters living within a few miles of a few stations. As far as most people are concerned, however, we do not have it at all. And no one knows, even now, when it will be ready for the general public.

Indeed, it might appear to the layman

that television has moved backward, instead of forward, since 1928. Baird's historic telecast spanned an ocean, but the pictures which you may see eventually in your home probably will come from a transmitter, the effective range of which will be limited to the horizon line—twenty to fifty miles, depending on the height of the antenna.

If a 3,000-mile telecast was possible ten years ago, why are they limited to fifty miles now? There are several reasons.

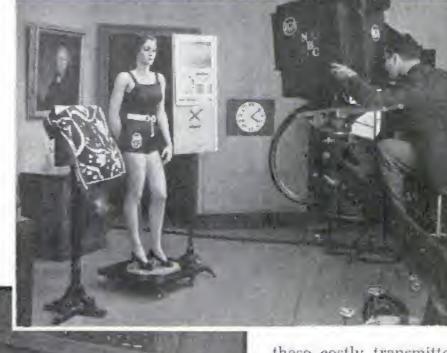

Clearer pictures are being transmitted today and they are being transmitted over short waves, instead of long ones. If a wide band of long-wave frequencies were available, and if weather and other conditions are favorable, the range of good television signals is sufficient to transmit a low-definition picture clear around the globe, according to C. W. Farrier, NBC television coordinator.

But to transmit a picture of high definition by short wave and under varying con100-5 Celeptocan succes

# TELEVISION NOW?

ditions, the dependable radius of a single transmitter has been found to be limited to the horizon—about as far as you can see. To send a program beyond the horizon without fear of failure, two or more transmitters must be connected by co-axial cable, the only known metallic conductor which can be used for telecasting.

And co-axial cable, capable of conducting fre-

Engineer at control board as he monitors television image. Above, locusing on Miss Patience in television studio before a telecast

quencies as high as 1,000 kilocycles or of carrying 200 telephone conversations at once, is expensive. But this is still inadequate for modern high-definition television transmission. One such circuit now connects New York and Philadelphia, but it will cost millions of dollars to crisscross the country with co-axial cables and link many transmitters together. Until this is done, however, there can be no chain television transmission like the radio broadcasts which go out to a network of stations from a central point.

Also, a television transmitter costs more to buy and to operate than a radio station of comparable quality. And even after these costly transmitters are built and linked together by co-axial cable, only those living within a few miles of the transmitters will be able to receive pictures.

A television receiver is much more complicated than a sound receiver because it must be exactly in step with the transmitter to the millionth part of a second or there will be—no picture. Video, as television may soon be known, is a system of

synchronizing and harmonizing many vital parts. If receivers and transmitters do not fit, as a key fits a lock, the system cannot function.

One stumbling block to public television today is lack of standardization. Uniform standards are more essential in television than in sound broadcasting because of the precise synchronization required between transmitter and receiver. Standardization will enable you to "look in" on two or three video programs in your territory instead of only one. Ten standards have been agreed on and a committee of the Radio Manufacturers' Association is attempting to agree upon others which will enable re-

POPULAR MECHANICS

white, "two" signifies gray and "three" black. By dividing the scene into imaginary squares, 100 each way, numbering them in sequence from one to 10,000, and sending a friend 10,000 digits, each representing the shade in one square, you would enable him to reproduce the scene on a sheet of paper ruled into 100 squares each way.

Obviously, this would be a tedious process. If, however, instead of sending numbers by telegraph code, you transmitted one

ceiver makers to provide instruments which will not become obsolete over night.

Despite the rather gloomy outlook for television for the masses in the immediate future, notable advances have been made in the art in recent years. One of the most important was Dr. Vladimir Zworykin's invention of electronic scanning which helped overcome the time element, one of the big problems in television, but of no consequence in sound broadcasting.

In sound broadcasting, Arthur Van Dyck of RCA points out, only one sound is transmitted at a time and this sound, even if it is a complex one, can be represented by

one electric current. But no picture can be represented by one current or one anything else because it is composed of many elements. If you look at a scene ten feet square from a distance where the eye can see objects one inch in diameter, there are nearly 15,000 one-inch areas, which you must describe to convey the exact scene to someone else.

Given unlimited time, you might do this with a simple telegraph code. Suppose you arrange a code in which "one" means

Regulation television receiver and three-by-four-foot screen on which image was "stepped up." Above, "Kinescope" projection tube which cast enlarged image on screen

electric impulse for each square in sequence, the strength of each impulse corresponding to the degree of light in the square it represents, you might send a description of the picture in 10,000 seconds, or two and one-half hours, if you transmitted one impulse per second.

At the receiving end a printing device would be necessary to record each impulse in the same order and location and with an ink intensity corresponding to the current intensity of each impulse. The chief prob-

## POPULAR MECHANICS

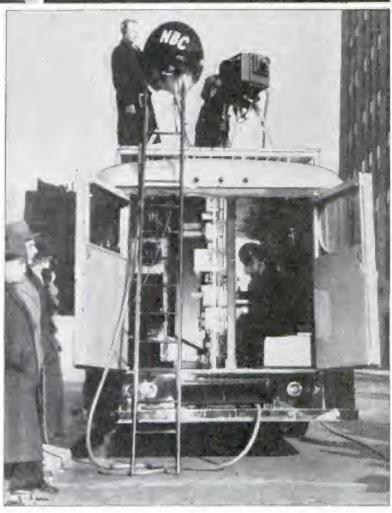

lem is one of synchronization between transmitter and receiver. This is the facsimile system, used on wire and radio, except that several impulses are sent each second, so only ten minutes or so are required to transmit a picture, instead of two and one-half hours.

But here's the rub. Television must transmit moving scenes, sending as many as thirty pictures per second so that, as in the movies, the eye will be deceived into believing it sees a continuous scene rather than a succession of stills. To send thirty pictures per second, transmitting information about each little part of each picture and repeating the process many times each second, a system 18,000 times faster than facsimile is required.

Here we have the primary cause of most of the television engineering problems—the time element, the necessity for transmitting an enormous amount of information very accurately and very quickly. Electronic scanning with the aid of the "Iconoscope" has helped solve the problem.

The Iconoscope converts light waves into electricity just as the microphone converts sound waves into electricity. The Iconoscope contains a plate upon which the scene being televised is focused. The surface of this plate is covered with thousands of photoelectric cells, microscopic in size,

Mobile television unit which picks up both sight and sound. Top, girl as she appeared before "Iconoscope" camera and the 441-line televised image of girl as it appeared in television receiver

each separate from the others and each generating electric voltage proportional to the light which strikes it. To use these voltages, they must be collected from each cell.

This might be done by brushing a tiny wire across the plate, contacting the whole area bit by bit. But the idea is imprac-

Photos at top (c) by Felix the Cat, Inc. Above, left to right, image transmitted with sixty-line, 120-line and 441-line definition. Dots on map show locations of television receivers in New York metropolitan area which get programs from antenna atop Empire State building, below

441 lines is the best compromise between picture quality and apparatus difficulty and this number has been made standard for this country.

The beam explores the whole plate thirty times per second and there are about 250,000 spots to be thus visited. It "reads" from left to right at two miles per second, and from right to left at twen-

ty miles per second. If your eye could move that fast, you could plow through a 1,000-page book in about five seconds. Thus this beam is about the busiest thing in this world.

The electric currents obtained by the beam from the cells are small but they can be amplified and then you have currents carrying intelligence representing the picture. These currents control the transmitter antenna current. At the receiving end, the entire process is reversed with the aid of the "Kinescope," the inverse of the "Iconoscope."

The Kinescope has a plate and beam of electrons playing

tical, partly because of the speed with which the operation must be performed. So a beam of electrons is utilized instead. This tiny "searchlight" travels over the plate, line by line, collecting the electric charge from each cell in turn.

The present standard calls for 441 of these lines on the plate from top to bottom, whereas the first systems had only twenty-four. The greater the number of lines, of course, the greater the detail of the pictures. But the more lines there are to cover, the more work the little beam must do and the more information there is to transmit. It has been found that

upon it, just as does the Iconoscope. In the former, however, the plate or screen comprises one end of the tube itself, is made nearly flat, and coated on the inside with a thin layer of material which fluoresces, or gives off light, when electrons strike it. When the electron beam in the Kinescope strikes the screen in one spot, about the size of a pinhead, this spot glows, its brightness varying as the strength of the beam varies.

That spot of light is used to reproduce each spot of the picture, one at a time. The beam "paints" the lights and shadows of each tiny element of the picture as a series of spots, but to our slowly reacting eyes, the spots are not visible and the screen appears to be illuminated evenly all over. The fly-

ing beam of the Kinescope must be in perfect step with the flying beam of the Iconoscope, miles distant, or there will be no picture. Synchronization is one of the television problems which has been solved.

Scenes of any size can be televised by the transmitter but at the receiving end, the size of the picture is determined definitely by the size and brilliancy of the Kinescope screen. At present, there are two standard sizes, one about five by seven inches, the other about seven by ten inches. Last fall, NBC showed television on a seven-byten-foot screen, but there is a size limit for the tubes beyond which it is impractical to go. It has been found that the most desirable size of picture for television or movies is one where the height of the picture represents one-fourth the distance between screen and observer. In the home, the desirable viewing distance may be eight or ten feet, so the picture height should be about two feet.

"There is good promise of eventual accomplishment of this goal," says Mr. Van Dyck, "but at present it seems probable that the television receiver which is 'just around the corner' will have a picture about seven by ten inches."

Partly because so much information must be crowded into so small a period of time, tremendously high frequencies are necessary in television. Your light circuit

## From Block to Blockhead in Two Days' Time

There's no such thing as mass production in the dummy-making business. One day your triend Charlie McCarthy was a chunk of wood. Next afternoon he was Charlie McCarthy, ready to talk if someone would think out loud for him. In two days a block becomes a blockhead, without benefit of factory methods. Every dummy is made to order, chiscled to fit the personality desired by the ventriloquist; only one machine operation takes place, the slitting of the dummy's chattering chin by a bandsaw. The rest is hand work. Above, you see a dummy's brain: the finger controls which manipulate chin and eyeballs. From top down around the page are the first stages in a dummy's life: a cube of basswood or buckeye; chiseling out the face contours: shaping the mouth; screwing the head together after installing "brains," and sawing the chin

Jugares used by all leading POPULAR MECHANICS ventraquests

Chiseling Dummies Is a One-Man Industry

"Daddy" of most stage dummies, including impish Charlie McCarthy, is Frank Marshall of Chicago. For twenty years he has been carving blockheads and marianettes for the theatrical trade; skilled fingers, a tool chest full of assorted chisels, a bandsaw and paintbrush his principal tools. The dummy starts as four slabs of wood glued into a block, with paper glued in the center so that the head can be split apart and hollowed out. Simplest of dummics have only a movable chin, but Mr. Marshall will, if you like, install eyes that roll from side to side, and a winking eyelid; or a soft leather upper lip that curls upward in a smile revealing a nice set of teeth. The mouth can be manipulated by a remote-control air bulb. In the circle is a split head, the wobbling chin sawed out, rendy for installation of mechanism. Below, touching up eyebrows and complexion with special dull-finish paint containing pumice. Right, Mr. Marshall has a farewell chat with one of his "babies"

RIDING HOBBY HORSES

A MUSICIAN whose hobbies included riding and photography decided, some years ago, that his neighbor's horses ought to be recorded. So he took his camera along on one of his saddle expeditions. In due time, he had two dozen horse pictures which he carried with him the next time he went riding, and proudly showed to the neighbor and several other horsemen.

A few minutes later he tore the prints into tiny bits, all twentyfour of them.

There had been nothing wrong with those pictures, photographically, but from the standpoint of the horsemen, they were total failures, because the horses were not shown in the approved manner. Ears were down, tails were out of kilter and various

Top, one of Photographer Shannon's finest pictures of a filly. Center, Shannon focusing his copy camera. Bottom, picture of a champion hackney, showing extremely excellent leg action

other details were either too much in evidence or too much concealed.

From that failure, the musician-horseman-cameraman has traveled a long way, and is now one of the three leading photographers of horses in this country. To-

m

Top, left, fine harness horse, with good leg action. Right, draft horse in typical pose. Bottom, Shannon in action

day, Ray Shannon's name and work are known wherever horses are to be found, fine horses, that is, such as those kept in the leading stables and exhibited at horse shows.

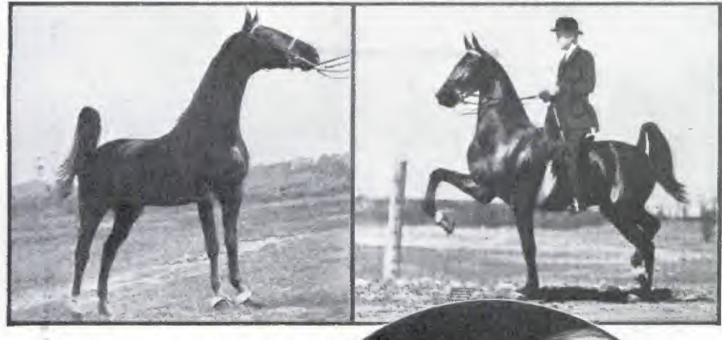

To become a successful horse photographer he had to become first a horse expert, had to find out just how to pose horses to show the fine points in which their owners and other horsemen were mainly interested. He learned the language of the stables so he could talk intelligently with trainers. He studied the characteristics of three and five-gaited horses. To study more accurately the actions of horses' hocks, knees and muscles, he took thousands of feet of

slow-motion movies, and spent untold hours examining them on the screen.

Before long, his horse pictures began to attract attention and found ready sale. Soon all his spare time was taken up by horse photography, and in a short while, he began devoting all his time to the business which had developed from a combination of his two hobbies.

Shannon has for his "beat" the greater part of the United States. For lack of time, he confines his field to the regions east of the Rocky Mountains. Wherever there are to be found high-class breeding stables. horse shows and private stables, his lens is seen in action at least once during the course of a year. He shoots horse pictures winter and summer, in good light and bad. He has photographed the fine saddle horses, in which type he specializes, of most of the wealthy sportsmen and sportswomen of the country. Much of his work is done in Kentucky, Ohio and Texas. To reach the stables where the horses are kept, he travels in an automobile loaded with equipment. One nine-week trip of 11,000 miles is a sample of the way he gets around. Now his jobs are almost always assignments. He generally is booked for a solid year ahead.

Shannon uses various kinds of cameras including reflecting types, but the bulk of his work is done with a four by five speed camera of a type popular with news photographers. Its focal-plane shutter, normally working at top speed of 1/1000 second, is pepped up by stronger springs until it

provides a minimum exposure of 12000 second. none too fast for stopping all action of a horse's feet and legs. Seldom does Shannon start out on a job with fewer than a hundred holders loaded with the fastest film he can get.

For a long time, Shannon did his work in a small darkroom in the basement of his home in Cleveland, Ohio. He finally was forced to expand, which he did by excavating the area beneath the front porch, and building two rooms there. One is a completely equipped photographic laboratory, with sinks, enlarger and other standard equipment. The other

room contains a desk,

worktable, copy camera and airbrush tank. When Shannon travels, he takes along Cleveland, where a laboratory assistant develops them and makes prints, which are forwarded to Shannon at some point in his itinerary.

### Skyscraper Tests the Nerve of Window Cleaners

Clinging like flies to the building, these window cleaners constantly flirt with death

Always flirting with death, skyscraper window cleaners constantly entrust their lives to the harness-leather belts as they dangle high above the street. The world's tallest building, the Empire State, which rises 1,248 feet above the sidewalks of New York, has its own window-cleaning force. Its staff of workers are employed the year around and are paid an exceptionally high rate for unskilled labor. These window cleaners are a picked lot, unaffected by high-altitude work. They receive frequent medical examinations and are insured. Despite the hazardous work, none has fig-

ured in an accident since the building was erected. This is due in part to the strict rules which forbid crossing from window to window from the outside and to frequent checkup on equipment. The cleaners never work singly, under a regulation placed in effect after one man was locked out by the sticking of a newly painted window. In that case, the worker was forced to kick through the glass to get back inside.

### "Nearest" Star Loses the Honor to Thirty Closer Neighbors

"Wolf 424," recently announced as nearest fixed star, is not so close to earth's door after all. Observations of the star's spectrum at the University of Chicago's Yerkes Observatory indicated it had the large parallax of eight or nine tenths of a second, meaning it was close to the earth. But Dr. D. Reuyl of the University of Virginia's Leander McCormick Observatory has found by the trigonometric method a preliminary parallax of only one-fourth that found at Yerkes, indicating that thirty or more stars are nearer than is Wolf 424.

### Upturned Rowboat Forms Roof of Tiny One-Room Cottage

All's shipshape in this little cottage at Whitstable in Kent, England! An upturned rowboat forms the tight gable roof of the one-room house, whose walls meet in a point beneath the bow of the boat. Not so nautical is the big brick chimney.

Tight little cottage in Kent, England, built to fit its roof—an upturned rowbout

## Baseball Game for Blind Is Played by Sound

Although none of the players can see, there's real action in baseball games at the Industrial Home for the Adult Blind, Oakland, Calif. Sound baseball, originated by Superintendent R. V. Chandler, is played with a playground ball containing jinglers which produce sound when it is rolled, batted or otherwise put in motion. A different toned buzzer sounds at each base as the runner advances and a bell rings at home plate. The players use a regular-size indoor baseball diamond. There are ten men on each side. One catcher, who has partial vision, is used by both teams. The fielders kneel on a pad placed back of the base path between the bases. When the

pitcher, who has sight but who does not bat, rolls the ball toward the catcher, the batter judges its location by the sound and swings a hockey stick. A control board, operated by an umpire with normal sight, signals whether the ball hit by the batter is fair or foul and the fielders then attempt to stop the ball by judging its position solely on sound. A put-out is scored by rolling the ball between the runner and the base toward which he is advancing.

Astronomers estimate there are 100 billion stars in the "neighborhood" of the earth—so close their light reaches us within 100,000 years.

### Radio Installed on Tractor Lightens Farm Work

Top, closeup showing radio beside driver. Bottom, starting for the fields

Installation of new or used automobile radios on tractors to relieve the monotony of farm work is becoming popular. One Nebraska farmer has used a radio in this manner for two years. The big problem usually found in attaching the radio is that vibration is difficult to eliminate. If the tractor has rubber tires and a well-constructed radio is used, the chassis and speaker are mounted so that no direct shock can reach them. The speaker is placed near the operator's seat, making it unnecessary to muffle the motor exhaust.

### Aluminum-Shod Race Horses Set Many Track Records

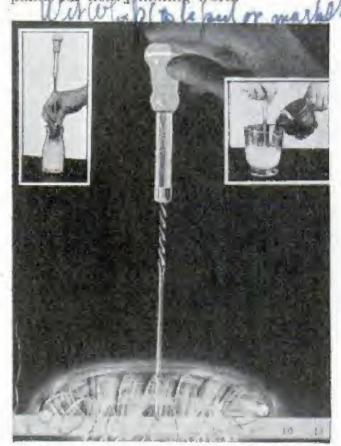

Thoroughbreds shod with aluminum are marking up new records on the racetracks of America. The aluminum racing plate was introduced by Leonard Liepman, Maryland sportsman, and in the last five years 300 track records have been lifted by horses running on aluminum—five of them world records and seventeen others American high marks. Most of the wear on a horseshoe occurs at the toe. Instead of using all-steel plates, a calk of extremely hard tool steel is inserted in the toe by a patented process, eliminating half the weight. The aluminum plates weigh only two ounces. They have withstood rigorous tests for wear and today probably four-fifths of the race horses on American tracks wear them.

electrically operated these days. Electrical, installations on ships have to be the sturdiest and most reliable made, for scores of lives may depend upon marine electrical equipment operating under conditions in which ordinary equipment would fail.

Once a ship's chief electrician on shore leave attended a movie showing news reels of the burning of a big liner at sea. The news commentator, describing the episode on the screen, declared that the crew and passengers had to abandon ship because the electric pumps failed and there was no water to fight the fire.

Suddenly the electrician gripped the arm of his neighbor. "See the water coming out of that discharge pipe on the side

DRACTICALLY everything on ship- of the ship," he demanded. "There's an board from the whistle gear down is electric motor behind that pipe running the pump. The electric motors haven't failed after all. That ship has been on fire and abandoned by all hands for five hours and the motors are still running. They'll keep on operating until the motor coils burn up or the steam supply fails."

Subsequent investigation revealed that the crew really had abandoned ship because smoke and gas fumes filled most of the vessel and made it unbearable. What really happened, the investigation disclosed, was that the ship's air-circulating equipment actually had helped to increase the fury of the fire and to spread its effects all through the ship. No one had thrown the switches to turn the motors off. Today rigid orders are posted on all vessels that

## ELECTRIC LINERS

the first thing to do when the fire alarm sounds is to shut down all ventilating intake motors and to keep all air exhaust motors going so as to provide no more fresh air for the fire and to clear the ship of the smoke and fumes.

Standing in front of his long switchboard on a balcony over-looking the main engines, the chief engineer plays an important part in getting a ship out to sea and settled down for its voyage. Electric motors operate most of the pumps in the fire rooms and engine room, and pumps are a vital part of marine engines.

Getting under way is different on every voyage. The bridge may ask for its standard cruising speed,

Left, inspecting electric motor. Right, top, telephoning engine room from bridge. Bottom, writing engineroom log. Blackboard contains instructions for staff and time of next sailing

a certain number of propeller revolutions per minute, but there are no standard adjustments that can be made in the fire rooms and engine room to provide it. A head wind means bucking the weather, and more steam has to be provided and the engines must work harder to keep up the revolutions. A following sea helps to push the ship along, and adjustments may have to be made to keep the steam pressure down. If the oil in the fuel tanks is cold or if a shift is made to a tank having a different temperature, blower speeds have to be changed and burners adjusted to

maintain the proper heat in the boilers. In the engine room a hundred gauges are watched and pumps have to be speeded up or slowed down until exactly the correct readings show on the instruments.

During this period of adjustment the chief electrician stands watch over his control boards, making sure that power is available where it is needed and ready to route power through different combinations of switches if something goes wrong. The electrical staff of a big liner numbers only a small handful of men, yet the chief electrician is considered almost as important as the chief engineer.

On fast luxury liners, such as the Grace Line's "Santa Paula" and her sister ships, all the electrical equipment is designed to operate automatically as much as possible. In port, when the main engines are shut down some steam is maintained all the time to operate the turbines that spin two 500-kilowatt generators which are kept running to supply power for the ship's pumps, deck machinery, and lighting. After the ship gets under way and the "all clear" bell is rung from the bridge, the chief electrician cuts in two similar generators that are attached directly to the ship's main turbine gears and then the entire load is taken over by these attached generators. The load at sea is normally 2,600 amperes at 220 volts.

In an emergency, such as a quick stop in which the main engines are shut down, the ship would be without current temporarily except for an automatic arrange-

Above, operating valve which closes all watertight doors at once. Bottom, left, checking lubrication of bearings. Right, inspecting part of ship's fire-fighting equipment

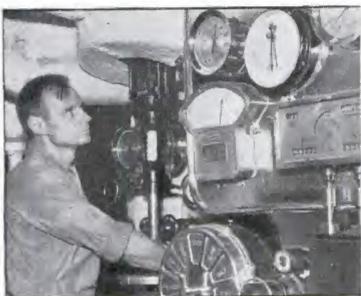

ment by which the two idle steam-driven generators are immediately started up and the load is switched back to them.

In the improbable event that all of the main generators are put out of commission, as might happen if the engine room becomes flooded, all lighting eircuits immediately and automatically switch over to several tons of 340 ampere-hour standby batteries and continue to draw power from this source until the emergency motor generator is cranked up and operating. Either of these emergency sources is able to provide power for operating the ship's radio, the navigating lights, and to illuminate the ship's interior. Both the batteries and the emergency generator are located on the upper deck.

On the "Santa Paula" there are some 200 power motors un-

der the care of the chief electrician, ranging from a 100-horsepower motor on the
main feed pump down to two-horsepower
motors, as well as numerous smaller motors such as those used to operate cabin
fans. One heavy motor is kept connected
all the time the ship is in commission, to
operate a large pump that keeps up pressure in the fire mains. In case of an alarm

### Midget Photoengraving Plant Built on Table

Short of Pilate. The

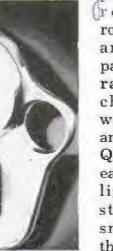

Designed to meet the needs of the small daily or weekly newspaper, the amateur photographer and the artist, a midget photoengraving plant has been introduced. The plant has a maximum plate size of six by eight inches. The entire equipment, built into a table three by six feet, consists of camera, retouching desk, whirler, printing frame, printing lamp, burning-in stove, powder cabinet,

roll-up table and motordriven etching machine. The unit is shipped ready to be plugged into the nearest electrical outlet.

Top, examining plate. Center, photoengraving plant mounted on table. Bottom, closeup of the equipment. The plant produces engravings six by eight inches

# Handy Pocket Gauge Measures in Fractions of an Inch

Measuring in fractions of an inch, from sixty-fourths up, an accurate pocket gauge is on the market. The tool is handy for picking out drills,

read scale #2

reamers, taps, round or flat stock and odd-shaped parts. It is accurate enough to check sizes of work-in-process and finished goods. Quick acting and easy reading, the lightweight instrument is so small it fits into the vest pocket.

Sound recordings on film, similar to that used for motion pictures, may replace the wax disk transcriptions used in radio. The sound-on-film process has been worked out to a point where it apparently offers these advantages over wax transcriptions:

popular MECHANICS Call

first, the original cost of a feature-length show on film is about one-third that on wax; second, sound film projectors start and stop instantly; third, lengths of shows can be varied with sound film. from five minutes to four hours, whereas the wax record runs but a short time, and fourth, it is possible to make an entirely new show or a combination of shows from the recorded film on file by selecting musical numbers from the film and "dubbing in" the commercial announcements. A vacuum drum, instead of a sprocket, is used with the sound film to give the sound an even motion, free from flutter. With the elimination of sprocket holes, film that is torn or otherwise damaged can be run through the machine with no difficulty. where it would ordinarily require mending or cutting.

## Strange Armored War Car Captured in Spanish Drive

This monster of war, an armored car with protective chains attached to front of fenders and apron, was captured in Spain recently

Latest of strange machines employed in war is an armored car of new design being used in the Spanish civil strife. Said to be of Russian origin, one of the grim-looking vehicles was captured by the rebel army in its drive toward the Mediterranean. Heavy chains, attached to the lower edge of the fenders and the apron beneath the nose, are a feature. Closely screened openings admit air to the motor.

## Camouflaged Attack Planes Maneuver in Sham Sky War

Camouflage in peacetime air maneuvers was tried out recently by the 98th Attack Squadron. The speedy sky fighters were dressed up in blotches of cloud-like paint to make them difficult targets either for

anti-aircraft batteries of the defenders or squadrons of "enemy" planes. The squadron was inspected at the <u>Hartford</u>, Conn., flying field before participating in the maneuvers along the eastern seaboard.

In preparation for "invasion" of New England, these sky fighters are being camouflaged with blotches of paint to render them invisible—or at least poor targets—for enemy planes and anti-aircraft guns

CLOAK of FIRE Guards

By H. S. Card

Development Director, Electric Welding Section, National Electrical Manulacturers' Association

WHEN science found a way to cloak a drop of liquid steel in a protecting blanket, for a journey of not more than a quarterinch, there developed a rapid and complete reversal of engineering and industrial viewpoints concerning the metallic arc-welding process. Where are welding had been considered unreliable, it soon became the key to some of the most significant industrial improvements made in recent years.

The process is not new, but there have been limitations on it which no longer exist, limitations which caused engineers to protest when it was proposed to weld this or that structure. Those same engineers today will request the

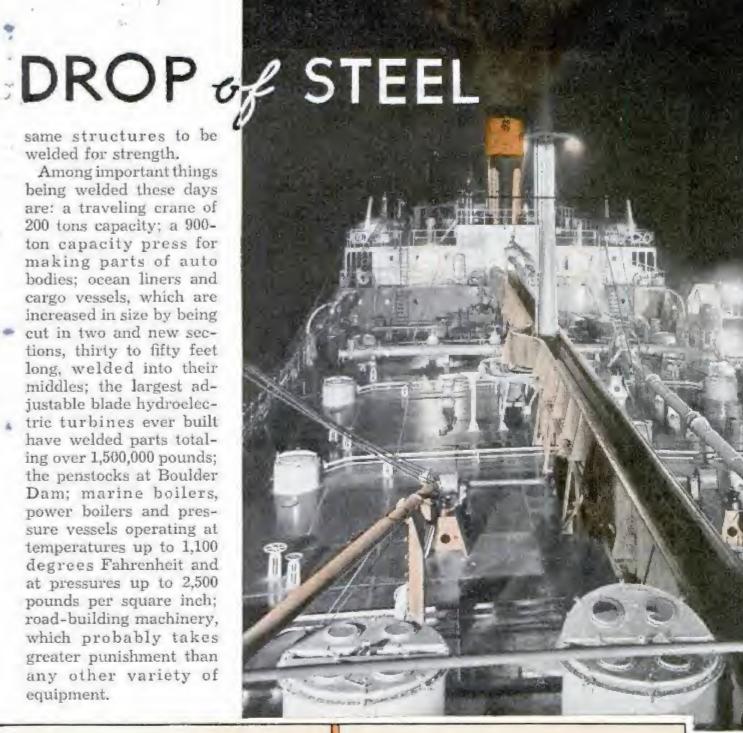

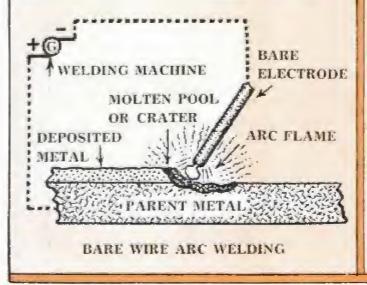

Left, welder at work. Special glass in helmet enables him to see through are glare. Right, welding frame of industrial building

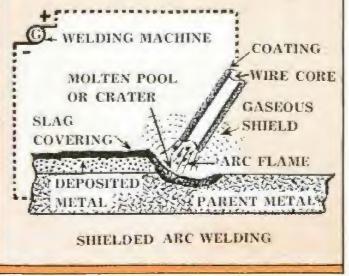

Van Dyke, built for

same structures to be welded for strength.

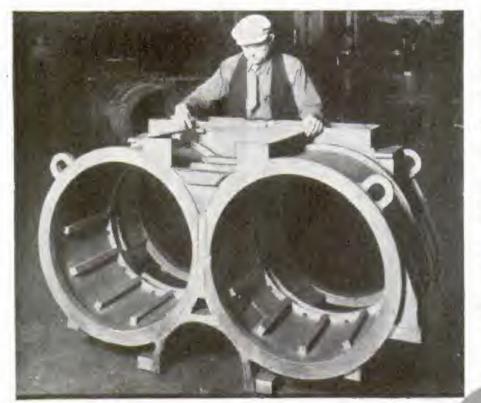

Among important things being welded these days are: a traveling crane of 200 tons capacity; a 900ton capacity press for making parts of auto bodies; ocean liners and cargo vessels, which are increased in size by being cut in two and new sections, thirty to fifty feet long, welded into their middles; the largest adjustable blade hydroelectric turbines ever built have welded parts totaling over 1,500,000 pounds; the penstocks at Boulder Dam; marine boilers, power boilers and pressure vessels operating at temperatures up to 1,100 degrees Fahrenheit and at pressures up to 2,500 pounds per square inch; road-building machinery, which probably takes greater punishment than any other variety of equipment.

Top, 18,500-ton welded tanker which holds gasoline enough to supply 10,000 motorists for a year. Bottom, diagrams comparing old welding method (left) with the new process (right)

until it has cooled and solidified. This method is often described as welding with heavily coated electrodes, but the term "shielded-are" is preferred. It took the combined efforts of chemists, metallurgists and electrical engineers, working experimentally for more than twenty years, to translate the original conception of this device for protecting arc deposited steel into practical and economical utility. Now that it has been done, a properly welded

The principle of arc welding is as simple as burning the tip of your screwdriver while testing the battery in your car. The work to be welded and a handle gripping a piece of steel wire are connected by cables in a suitable electrical circuit. The end of the wire is touched lightly to the work piece and withdrawn in the same motion, to start a tiny arc. A fierce heat is generated, which melts both the end of the wire and a small crater of metal in the work piece, and as long as the arc is maintained there is a flow of metal from the wire to the work, which, in general, consists of two separate pieces of steel placed close enough together so that the crater can bridge the junction and thus be fused into a solid piece. If this is done in the open air the liquid steel will pick up oxygen and nitrogen, and after cooling will not be so strong as steel normally is.

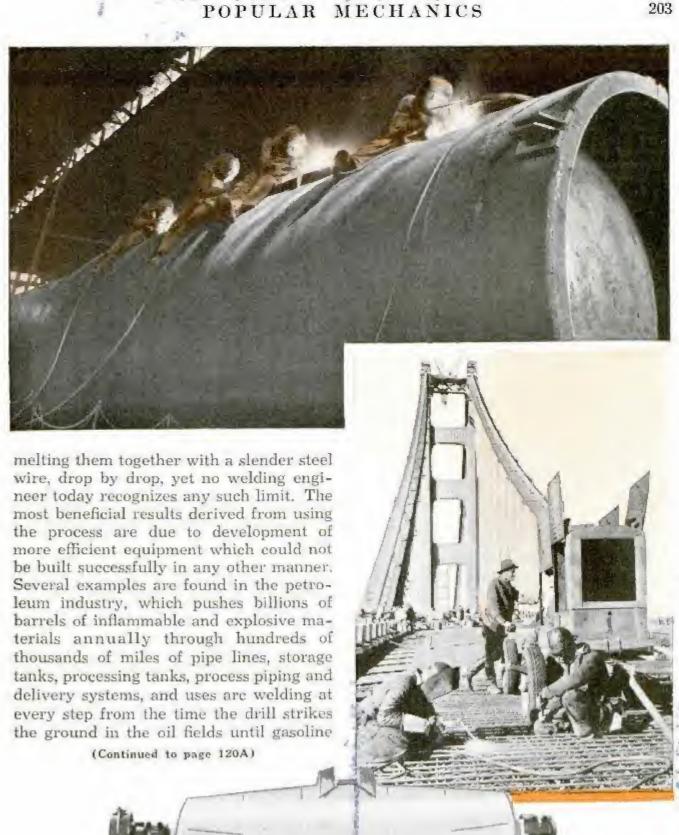

Today's preference for arc welding is largely accounted for by that matter of shielding little drops of steel from the air. This was accomplished by coating the welding wire with a substance which melts simultaneously with the wire and causes a blanket of incandescent gas to form around the stream of molten drops and over the welder's crater, shielding it from corrosive action of the air and finally laying a thin, impervious crust of slag over the deposited metal to protect it further Top, welded twin motor frame for streamline loco-

motive. Bottom, welded sewage sphere

structure is solid, one-piece, jointless, and cannot be jarred, ripped or pulled apart by any force insufficient to rupture the parent metal itself.

First-class welds are commonly even stronger than the parent metal. For example, an arc-welded radio antenna tower was nearing completion last year when a guy rope snapped and fifty tons of steel work crashed to the ground with such terrific impact that the upper sections were completely buried and a number of the solid three and one-half inch round bars snapped apart, but not a single weld cracked, out of a total of about 3,800.

It might seem fantastic that there is no upper limit to the size and weight of structures which can be built up safely by

## Projected Scene Helps Make Composite Photo

Circle, ready to project scene Shown below) on screen. Bottom, subjects seated before screen on which scene will be flashed. Top, right, picture resulting from photographing subjects and scene

By projecting a distant scene on a screen and then photographing a subject in the foreground, satisfactory composite still photographs can be produced. The process has been perfected by George J. Teague. It makes possible the photographing of persons or any object, such as an automobile, against a background of the Pyramids without the foreground subjects ever hav-

ing crossed the ocean. Teague's process involves the use of a large translucent rubber screen and a giant projector. The picture to be used as the background is placed on a lantern slide and projected on the huge screen. In front of this screen is placed the foreground part of the picture, usually people. Then a picture is made of the foreground and the scene on the screen, which composes the two and makes the finished photograph appear to have been taken in the locale pictured. The problem to be overcome was how to get enough light on the screen to permit normal exposure of the foreground without burning up the lantern slide. This was solved by treating the lantern slide in a hardening solution and by immersing it in a water cell during projection. Water circulating through the cell reduced the temperature and prevented blistering.

### World's Longest Lighted Road Spans New Jersey

When the lights were turned on in June, the White Horse Pike across New Jersey was pronounced the longest stretch of illuminated highway in the land. The state has installed the lights the full length of the fifty-six mile road from Atlantic City to Camden, using a few sodium lamps for

test purposes but chiefly the luminaires developed by General Electric engineers. These incandescent luminaires consist of a hemispherical reflector and prismatic refractor which flood the pavement with light in an elongated oval pattern, shielding the eyes of the driver from glare.

### Metal Picnic or Shopping Basket Folds Up for Storage

Folding baskets for pichics, marketing trips and general use, made of light metal

4 21

to withstand long, hard service, have just been put on the market. They collapse into a small space for storage in cabinet or drawer, and are easy to open. Bottoms and handles

are of metal, handle grips are hardwood and side walls are heavy duck, mildewresistant and water-repellent.

#### Two-Way Wheel for Motorboat Lets Pilot Stand or Sit

Motorboat skippers find added convenience in a two-way steering wheel offered this year. It tilts to vertical position or lies horizontal, making it readily accessible for the pilot whether standing or sitting.

Vertical wheel, above, in convenient position for pilot standing; below, position when pilot is seated

### Steel "Silo" Atom Smasher Holds Big Vacuum Tube

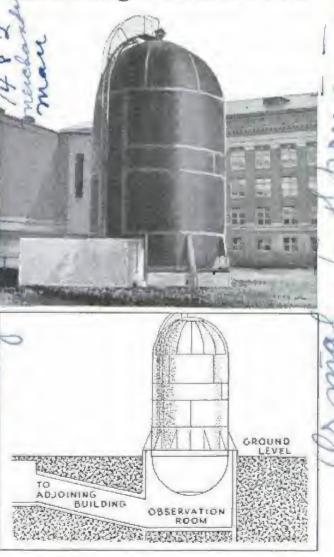

Photo and diagram of atom-smashing tank on Minnesota campus. Its steel walls are ejectric-welded

remues Like a great silo thirty-six feet high and eighteen feet in diameter, a forty-ton atom smasher is being equipped on the University of Minnesota campus for experimental work. Its electrically welded wall of prefabricated steel is one and one-fourth inches thick, built to withstand pressures up to 100 pounds per square inch. Radioactive elements whose characteristics permit scientists to follow their movements through plant and animal bodies will be. manufactured inside the tank by bombarding various "targets" with electric "bullets" shot through a twenty-one-foot, porcelain vacuum tube at a speed of 10,000 miles per second. Struck with such tremendous force, the target disintegrates and a new element forms. To safeguard the operators, the control room is shielded by a six-foot wall of earth and concrete,

### High-Efficiency Filament Burns above Melting Point of Steel

Straight coil is the old-type filament, spiral coil is magnified model of new high-efficiency filament

Without the aid of a microscope it is impossible to see the intricate twists of the tungsten filaments in the new high-efficiency lamps. Aluminum models of the old and new sixty-watt lamp filaments are being exhibited by the General Electric company to show the change in construction that increased light output ten per cent. Pencil-thick in the model, in reality the lamp filament is less than .002 inch in diameter. The tiny wire burns at temperatures nearly twice those at which Bessemer steel melts, yet is designed for 1,000 hours of life.

### Precision Valve Stem Grinder Saves Time and Labor

Correct tappet, clearance may be obtained quickly by using a lowpriced Ford valve, stem grinder now on the market. The precision tool correctly gauges Ford tappet clearance and then accurately grinds off excess material in one operation, saving hours of time and assuring perfect performance of the engine. The high-speed grinder motor operates on alternating or direct current.

### Motor-Driven Amateur Camera Films "Hollywood" Effects

Built for the amateur movie fan yet versatile enough to produce many "Hollywood" effects, a sixteen millimeter camera is equipped for spring or electric drive, and its battery-operated release can even "trip" the shutter for single-frame exposures by remote control. It has a doublelens turret and its basic f.1.9 lens is interchangeable with seven accessory lenses. For extremely sharp focusing—the camera is capable of filling your screen with an object only .047 inch in width-a reflex finder is provided, which, by means of its ground-glass screen and built-in magnifying glass, shows the exact field and focus of whatever lens is in use. With the accessory lenses it is possible to film as close

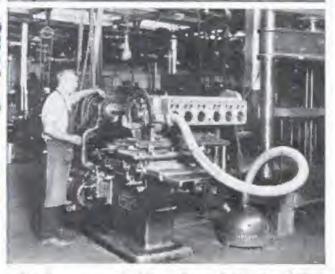

Sixteen-millimeter movie camera with electric motor, reflex finder and accessory lens attached

as eighteen inches from the object and cover an area only two and one-eighth inches wide. Almost microscopic magnification is achieved with extension tubes and a standard one-inch lens.

### Air Cleaner for Machine Shop Filters Out Smoke and Dust

Smoke-eater and dust-remover in one. a small air-conditioning unit developed especially for the welding and grinding shop filters about ninety-five per cent of the dirt from the air in the immediate vicinity of the work. A motor-driven fan sucks air through a flexible metal tube and exhausts it through a filter. The machine can draw smoke and heat away from the workbench, contributing to the efficiency of welders, and since it removes the dirt at its source, before it is mixed .through the air of the entire shop, it provides air-conditioning at lower cost. Heat is also conserved, since no air is brought in or blown outside the building.

Air cleaner mounted to suck smoke, heat and dirt away from welder's bench and grinding machine

### Clamp Holds Lawn Mower and Aids Repairman

Lawn mower, held in handy position by clamp, is easy to repair or to sharpen

Leaving both hands of the repairmanfree, a clamp which holds a lawn mower rigid in any position is now on the market. It eliminates the old method by which the repairman attempted to hold the mower steady with one hand and arm while he applied his tools with the other. The clamp suspends the mower at three points between roller and tie rod, with a snap hook around the center of the tie rod.

### Wool Made from Fish Albumin Mixed with Cellulose

Fish wool, made from fish albumin and cellulose, is being produced in Germany, another in that nation's list of synthetic products. Comparing favorably in strength, resistance to washing and wear resistance with good grade fiber made by the viscose process, which is widely used in the United States, the new product is precipitated from a solution containing fifty per cent fish albumin and fifty per cent cellulose. When the solution is spun out, the cellulose coagulates first and the albumin later, producing a thread with a cellulose core and an albumin outer sheath.

### Ventilator for Auto Trunk Makes It Safe for Dogs

Arrow points to ventilator, which adjusts to admit proper amount of fresh air to dogs riding in trunk

Hunters' dogs and other pets can be carried safely in the automobile trunk if a ventilator is provided. A vent which resembles the cap of the gasoline tank can be installed at the side of the trunk, well above the exhaust fumes. It is adjustable so that the proper supply of air can be supplied the dogs in warm or cold weather.

#### Low Cost Enlargements Printed from Miniature Negatives

As fast and as simple in operation as a contact printer, a photographic enlarger just introduced makes prints two and three-quarters by four and on e-quarter inches from double-frame miniature negatives of the thirty-five

millimeter size. Having a fixed focus and no adjustments to make, the process is easy. Ready-cut sensitized paper is laid on the glass and the printer handle pressed down a few seconds to make the automatic electrical contact and exposure. It is possible to make as many as 200 prints an hour in this manner.

### "Retired" Plane Finds New Job Guarding Fruit from Frost

13 30

Long since retired from the air lanes, a cabin plane once worth \$50,000 is on duty today protecting an orchard at Painesville, Ohio, from frost. The airplane was once owned by David S. Ingalls, former assistant secretary of the Navy. It has been hoisted to the top of a forty-foot steel tower, where it rotates slowly, its propeller sending blasts of air over the treetops to prevent dew from forming on the trees and freezing. On one occasion the prospective

Rotating slowly on top of tower, this plane-once worth \$50,000-fans air to prevent frost in orchard

1938 peach and apple crop was saved by building a fire at the foot of the tower when the temperature had dropped to twenty-six degrees. As the warm air rose it was blown through the orchard by the propeller. Not one bud was frozen.

## POPULAR MECHANICS Diamond and Coal Prove Purity by Float Test

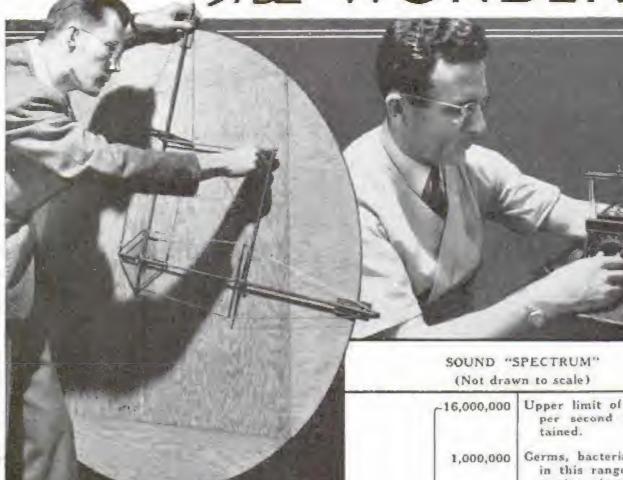

Diamond or paste? Ruby, sapphire, or spurious gem of mere colored glass? Pure coal, or fuel weighed down with worthless slate? Science has found one test for the purity of all these—the sink-float test. If you were to separate, simply, pebbles from chips of wood, you would immerse the lot in a bucket of water; the pebbles would

fall to the bottom, the chips float. It is not quite so simple as that to sort precious metals, to distinguish precious gems from fake, to separate pure coal from rock and slate and iron; but the same principle is followed. Instead of water, heavy liquids are used. Dissolving salts known as thallium formate and thallium mallonate in

water, a solution four times as heavy as water can be made. By varying the amount of salts, the specific gravity of the solution is controlled. Every pure gem has its own specific gravity: quartz 2.66, cut diamonds 3.54, tourmaline 3.1 and so on. To test a diamond's purity, it is immersed in a vial containing fluid mixed to a specific gravity of 3.54; the impure diamond will sink or float; the pure gem will remain suspended. Du Pont engineers recently developed several halogenated hydrocarbons, such as pentachforethane and tetrabromethane, the latter thrice as heavy as water, for use as "parting liquids" at the coal mine. A heavy liquid whose specific gravity is between that of coal and slate is supplied to the mine. Immersed in this liquid, pure coalbeing lighter—floats; slate sinks to the bottom. This process, enabling the coal operator to market a uniform, slate-free fuel of low ash and high heat content, is now commercially feasible, for there is little loss of the parting fluid and it can be used again and again. Before the coal is immersed in this heavy liquid it is treated with a solution of tannic acid or starch acetate which forms a film around the coal, preventing the parting fluid from adhering to the coal and slate and thus being lost for future

The WONDERS

Above, puntagraph arrangement by which position of pickup microphone inside small reverberation chamber can be changed

A KETTLE of water boiling lustily looks so hot that you wouldn't think of plunging your hand into it, yet if you should you would find that the water was just about at room temperature.

Liquid in a flat pan defies gravity and humps itself up into a liquid mountain. A metal rod projecting from a coil of wire is cold to the thermometer but you would get a bad burn if you tried to hold it. A chunk of glass crumbles into white powder upon command. Chips of wood burst into flames, and heavy oil vaporizes into a mist.

These are some of the queer tricks that can be played with a brand new science just emerging from the laboratory. Not much more than a decade old, ultrasonics has the promise of becoming a spectacular tool in science and industry.

Sound waves far above the limit of human audibility mix oil and water into a

Upper limit of vibrations per second so far at-Germs, bacteria; etc., die in this range. Used in marine signaling, and surveying, submarine detection. Ultrasonics-100,000 Lower limit for most biological and chemical effects. 32,000 Upper limit of measured insect sounds. 20,000 Average upper audible limit. 10,000 Highest frequency used in quality radio broadcasts. 1,000 Reference frequency in Audible Range . sound measurements, 250 Characteristic pitch of woman's voice. 125 Characteristic pitch of man's voice. - 16 Lower audible frequency. # of SILENT SOUND

homogeneous liquid. Mercury and water that never would mix before stir into a dirty emulsion, Chemical compounds change their identity. Bacteria that stubbornly resist age and heat shake apart and die. The discovery that a high-pitched noise annoys a disease germ offers important possibilities in medicine and sanitation. With one kind of sound you can softboil an egg without raising its temperature. With another kind of sound you can halt decay. Raw eggs treated with ultrasonics remain fresh for months at room temperatures. Other foodstuffs remain fresh and appetizing for weeks although untreated "control" samples of the same food shrivel

up or decay in a couple of days. Some types of bacteria live for fifty years and even strong germicides fail to kill the spores. Boiling, freezing and pasteurizing have no effect on them, yet they die at once when exposed to ultrasonic vibrations. Milk pasteurization at low temperatures, control of bacteria that affect the sweetness of sugar during refining, better control in the preparation of serums and the production of completely sterile solutions at ordinary temperatures are some things research workers expect will become practical.

In chemistry, ultrasonics acts as a catalyst in bringing on many reactions, and speeds up reaction time in others. Starch

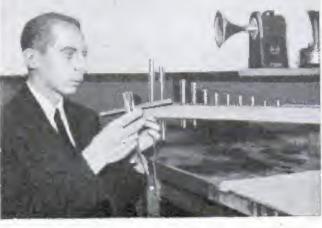

communicate by sounds that reach 32,000 vibrations per second. Only the lower notes of a humming bird's song are audible to humans and the rest of the time the bird seems to be silent although its throat swells and its beak moves as it keeps on trilling notes too high for us to hear.

Ultrasonics got its start when research workers learned to generate sounds that vibrate millions of times per second. Such noises are infinitely too high in pitch to be detected by the ear. Supersonic waves travel slightly faster than audible sound and the wave lengths become shorter as the frequency increases. Sixteen-cycle sound has a wave twenty-one feet between crests in air, 16,000-cycle sound is one-quarter of an inch between crests, and sounds vibrating 1,000,000 times per second have a wave length of one-sev-

breaks down into dextrin, acetylene is generated from vegetable oils, and other substances break apart or combine under the influence of the waves. Plant seeds speed up their maturing process and in some cases the genes are rearranged so that sports and hybrids occur.

Such miracles as these are achievements of "silent" sound. Sounds are simply mechanical ripples or pressure waves that spread through the air. Our ears are tuned to register only a narrow band of these waves and take no notice of vibrations that occur above or below the range of audibility. The shaking of leaves, the striking of a match, and the rustle of clothing all produce slight sounds that we can hear but in each of these cases other sound waves are also created that happen to be so high in pitch that they can't be heard.

The human ear is tuned to pick up sounds of from sixteen to around 20,000 vibrations per second, but some insects that can be seen but not heard by man

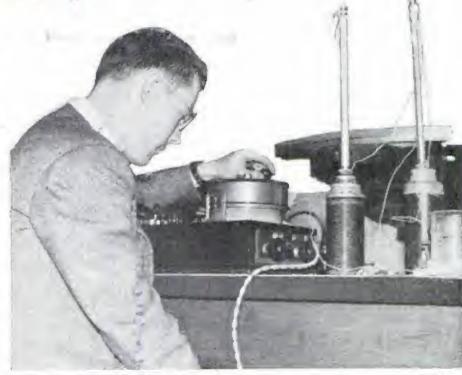

Left, wooden zone plates act as acoustical lens, gathering sound waves and converging them to a focus behind the open rings. Right, mounting magnetostriction rod in electrical coils that will cause it to produce ultrasonic waves

enty-fifth of an inch. Such high-frequency vibrations dissipate quite rapidly in air but travel for considerable distances in liquid.

High-frequency sound has some of the properties of light. It can be directed in narrow beams, it reflects back or at angles just like light, and it even may be brought to a focus. Used like a beam of light, ultrasonic vibration is useful in underwater signaling and surveying. It has possibilities for detecting the presence of near-by

ships in fog. One of its valuable uses is in submarine detection, for it can locate the exact position of a submarine even when the submersible is lying at rest on the bottom with all motors and electric circuits shut down. One type of automatic listening device has been used to detect the first change in note of rotating machinery so that incipient breakdowns can be avoided.

Sound waves of up to 100,000 cycles per second are generated by magneto-striction, the repeated constriction that occurs to a hollow metal rod when it is placed in an alternating magnetic field. This lengthening and shortening of the rod in turn creates tiny pressure waves in the air. From 100,000 cycles on up into the millions the pressure waves are best produced

Top, equipment used to keep track of temperatures in different parts of "dead" room, necessary for making corrections in studying speed of sound. Center, left, metal plates in reverberation chamber magnify sounds. Right, entrance to dead room where absolute quiet is obtained by insulation

by quartz disks. Pure quartz crystals have electrical as well as optical properties. A thin slab cut from such a crystal acquires small electric charges on its faces when the crystal is compressed. Conversely, electric charges applied to the faces compress the slab. Such crystals are used by radio broadcasting stations to stabilize their frequencies on the air and are also used in the crystal microphones that detect ultrasonic vibrations.

#### Now Charlie Can Walk Thanks to Carpenter

Charlie McCarthy, stepping spryly along on newly acquired legs, takes Edgar Bergen for a walk

By this time Charlie McCarthy has probably developed a very important strut and a condescending salute, for wooden-head McCarthy of the radio and movies is wearing a new set of arms and legs. Carpenters on a Hollywood movie lot fixed him up with properly jointed limbs. When he—or Bergen—learns to walk correctly on the stage and acquires good dramatic gestures, Charlie expects to become a great actor.

#### Movies Fade into Theater Wall Increasing Field of Picture

By means of a lighting arrangement just developed by two motion-picture engineers, the sharp border of present-day screens is abolished and the movie appears to fill the entire front of the theater. Pictures fade into the theater wall surrounding the screen, increasing the field of action and the effect of realism. Light transmitted through the edges of the screen is reflected around the edges; lights and shadows around the screen change in accordance with lights and shadows at the edge, giving the illusion that action is not confined to the screen itself.

#### Vise Holds Photo Slide Firm While Tape Is Applied

Binding of photo slides is made easier by a special vise with a locking action which holds the slide firmly during application of the tape yet permits it to be rotated. It locks at ninety-degree intervals corresponding to the four edges of the slide.

#### Tractor Built of Old Car Parts Run by Stationary Engine

When the Rev. W. T. McWilliams of Edison, Ohio, cultivates his garden he steers a homemade tractor out of the barn, hooks on his plow and demonstrates what can be done with a few old auto parts, a few dollars and donations. The tractor travels on automobile wheels mounted on a sawed-

This garden cultivator cost but a lew dollars, for it was homemade of odd parts

rence Dervel.

off Ford rear axle, connected to a Chevrolet transmission and, through beveled gears, to the pulley back of the engine. The pulley-on-belt clutch, manipulated by a handle taken from a small hand cultivator, is used on the three-inch driving belt. The motive power is a one and one-half horsepower stationary engine set on quarter-inch angle iron bolted to the two-inch boards forming the platform, which in turn is bolted to the axle and the small rear turning wheel.

#### Concrete Buoy to Guide Boats Is Topped by Lights

Replacing floating buoys, concrete shafts topped by big oil-burning red and green lights are being constructed on inland navigation streams. The concrete pyramid extends down into the bed of the river. The lights are mounted above the shaft and can be seen by boats at great distances. The markers also serve to record the rise and fall of the river, having a gauge on the side for this purpose.

Permanent concrete shafts like the one above are replacing floating buoys in inland streams

#### Work Capacity of Athlete Measured in Bike Test

While this athlete pumps his bicycle pedals, his heart is watched and oxygen consumption measured

How much work can an athlete turn out, and what does it cost him in oxygen consumption and heart effort? A group of Stanford University athletes has set out to measure their work-output capacity and "fuel" consumption while pedaling a test bicycle. The driving sprocket of the "bike" is connected to a dynamometer which translates leg effort into horsepower. Over the subject's head is placed a copper helmet into which measured air is pumped, then exhausted air from the lungs is piped away to be measured for oxygen depletion and production of carbon dioxide. One forty-five minute bicycle pumping test showed that the student breathed twenty. gallons of air per minute and his pulse was 195 beats per minute, sending seven and one-fourth gallons of blood through the heart each minute. His work output was one-quarter horsepower.

single rooms on separate levels feature the new streamline passenger trains on the Pennsylvania and the New York Central lines. The master rooms have two beds which fold up into wall compartments during the day; each is as wide as the traditional standard Pullman berth and can accommodate two persons. When the beds are folded away, four chairs are provided. These fold under the ter room is a bathroom with shower. Each railroad has assigned fifty-two new cars to its sixteenhour Chicago-New York trains. The Pennsylvania will use the equipment on four trains and the New York Central will have four complete 20th Century Limiteds.

#### New Ways of Using Wood ¶ 4 Found by Research

New and more efficient methods of utilizing the world's forests are permitting the wood products industry to approach the high efficiency of meat packers who boast that they use everything but the pig's squeal. Forests are now looked upon as a source of raw materials for cellulose derivatives, paper pulp, staple fiber, naval

stores, wood distillation products and wood plastics. In a recent address, Dr. H. K. Benson, professor of chemical engineering at the University of Washington, pointed out that through chemistry the supplies of pine trees in the south and the giant Douglas firs in the west are becoming available as sources of paper pulp, Through

#### POPULAR MECHANICS

research the naval stores industry is seeing new methods introduced. The older method of using rotted trees is being supplemented by new ways of using tree stumps for their high resinous content. Among the advances are improved stumppulling derricks and a tremendous 2,800pound stump ax which, falling vertically, splits the stump down the middle and makes for easy removal by ten-ton tractors. Great technical strides have been achieved in wood distillation, and wood plastics are finding increased use. The U. S. Forest Products laboratory is developing wood plastics by partial hydrolysis of wood and hot-molding the residue. Digestion of the wood under pressure in water and aniline also yields a material which may be molded. These plastics are hard, black, take a high polish and are cheap to make. At the University of Idaho wood is being gelatinized. Drying wood in a kiln removes the water particles surrounding the oriented structures and the wood shrinks. If water is now added, the crystallites in the wood spread apart, regular orientation is lost and a swollen, gelatinous mass of wood results. When this mass is compressed, the water is squeezed out without the wood regaining its former structure. What remains is a mass of continuous physical form like vegetable parchment and vulcanized fiber. This gelatinized wood can be molded and colored during the process. It is about twice as resistant to rupture as the original wood.

#### Mining on Target Range Recovers Lead Bullets

Dumping scrapings from target range into machine which recovers the lead bullets lub

Five tons of lead per day are recovered by a lead miner who reclaims the bullets fired on target ranges by members of gun clubs. The mining apparatus is mounted on a truck. A scraper is employed to collect the surface soil containing the lead shot, which may have been accumulating on the range for many years. Other apparatus washes the soil from the lead, leaving the metal to be sacked and sold.

#### Life-Size Figures Molded in Sand by One-Armed Artist

Note life-size sand model of the fallen hero and horse

Life-size, realistic models in sand are fashioned by a one-armed artist in an Indiana city. So true to life are the figures that they bring praise and coins from passersby. The artist's work is remarkably realistic and shows much attention to small details. The only tools used by the sand sculptor are several sharp-pointed trowels, paintbrushes of various sizes and a bucket of water.

thought to record the scene as passengers and crew, panic written on their faces, struggled toward lifeboats and clung to ropes stretched across the slanting deck.

Hanson had no speed flash bulbs, no costly lens, not even a fast grade of film. He had an inexpensive folding camera loaded with ordinary roll film. As the storm-battered "Vestris" began to list heavily he was sent below

WOULD you take \$9,000 for that prize snapshot of yours? Well, would \$13,000 interest you? It's not ridiculous. Good shots by amateurs with ordinary cameras have turned into "best sellers" earning money in four and five figures. In fact, some are worth more—and are recognized familiarly by more people—than a painting by an old master.

Who doesn't remember, for example, that famous picture of the sinking of the "Vestris"? It was one of the best sellers of all time: earned more than a thousand dollars for the young pantry man who was the only person cool enough in the face of death to cock a camera and click the shutter; and undoubtedly earned thousands for the picture services distributing it to newspapers and magazines. It is still earning money ten years later-witness the fact that this magazine paid sixtyfive dollars for the privilege of printing it here.

Probably there were many cameras aboard the "Vestris" but only Fred Hanson, a cook's assistant,

POPULAR MECHANICS

Hanson approached a man from the New York Daily News. He had snapped a few pictures, he said. He was hurried to the newspaper office, his roll was rushed to the darkroom. His pictures, best of them the dramatic shot reproduced here, made papers throughout the world.

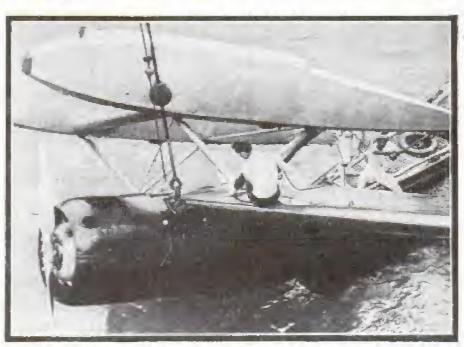

Of course, you don't have an opportunity every day to photograph a shipwreck. But more homely subjects are packed with human appeal and potential earning power.

Take the "Laughing Cat."
It happens to be from the camera of a professional. Russell Hamm, now staff photographer of the Chicago Daily News; but it could as easily have been yours.

Hamm had been sent down near St. Louis to make a feature picture of a mother cat with her litter of fifteen kittens. When he had finished, the woman owner remarked that she was training another cat to make facial expressions. Hamm asked to be shown. The lady set up a mirror in front of her pet and immediately the cat grinned and gri-

maced. The photographer took a shot at the reflection in the mirror and went home. From the developing tank came "The Laughing Cat," so genuinely humorous that newspaper, magazine and trade journal editors around the globe bought and printed it, and in fifteen years that picture has earned \$13,000!

Big money goes to those rare shots whose appeal is not just for the moment, but lasting. But thousands of less important snap-

Amateur scoop of 1938 thus far was the action shot of the collapse of the Niagara Falls bridge. There was a case where a whole colony of press photographers had been waiting for days to catch the crash. Yet not one professional got the big picture. An amateur did. For nearly a week an ice jam had been menacing the Falls View span. William K. Kirkwood of Simcoe, Ont., visiting Niagara Falls on a business trip, drove over for a look and a picture of the jam. The water level was reced-

ing and the newspapermen had relaxed their
vigilance.

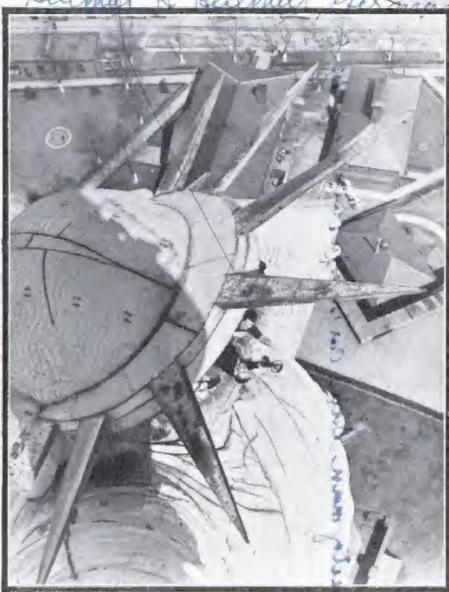

Just as Kirkwood raised
his camera, the bridge
buckled. As fast as he

his camera, the bridge buckled. As fast as he could, he wound the film, pressed the shutter release, wound it again. A matter of seconds, and it was all over.

Then Kirkwood wondered what he had. He didn't see any other cameras around, and on an impulse he telephoned a Toronto newspaper. The editor said he had his own photographers there and the big picture syndicates were covering him too. Mr. Kirkwood insisted he hadn't seen any photographers so the editor finally took his name.

By the time he reached his hotel there was a long-distance call from Toronto awaiting him. Would he please take his film right away to a certain address? He did. Press photographers who

## Traffic Sign Made Flexible to Bend when Hit

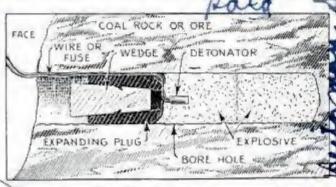

Demonstrating how flexible traffic post can be bent.

Note spring at base

When a new-style traffic sign in a Texacity is struck by auto or truck, it bends to the pavement and then returns to its upright position after the vehicle has passed. The sign is flexible. It was made by welding a large tractor spring to two lengths of iron pipe, one of which was set into the street paving in cement.

## Plug to Make Blasting Safer Seals Drill Holes

For safer and more economical blasting a plug is being used instead of ordinary sand or dirt bags to seal drill holes. The plug consists of a composition-rubber cylinder closed on one end and hollowed on the other with a tapered opening into which is inserted a wooden wedge of the same taper. The rubber member is chemically treated to eliminate toxic gases and odors in confined areas. After the charges

Sketch shows how blasting plug is arranged so that it seals the drill hole

of explosive has been placed in the drill hole, a plug, one-eighth inch smaller in diameter than the size of the hole, is inserted and followed with the wooden wedge until it rests against the charge, then the wedge is tapped with a tamping stick. By test, twenty-five per cent more breakage is accomplished with the same amount of explosive. In case of a misfire, an additional charge of explosive is put into the drill hole, resealed with another plug and fired, detonating the misfired charge. Thus are the hazards of handling misfired charges eliminated.

#### Welded Pipeline Crosses River as a Suspension Bridge

d 3

Welded pipeline slung on suspended cables "ferries" natural gas safely above flood level of river

High above the rampaging floodwaters of a river at Benson, Ariz., a natural-gas pipeline crosses the stream on a suspension bridge of its own. Spring floods made any ordinary pipe-crossing perilous, so the engineers raised two eighty-five foot towers, 1,000 feet apart, suspended saddles from the cables and then fed out welded pipes from each bank to the middle.

#### Building a Five-Miles-a-Minute Racing Plane

Tailor-made speed in the sky comes at the end of long months of planning and building in the aeronautical shop. Clayton Folkerts designed the trim little racing plane that Rudy King piloted to win the Greves and Thompson Trophy races in last year's National Air Races. Its top speed was 307 miles an hour. That was 1937. Folkerts has been months at the Kansas City Municipal Airport building his "SK-4," the ship he hopes will do 330 miles an hour

Top, tail assembly; bottom, the supercharged 400-horsepower motor of the "SK-4." Left, skeleton of the racer, showing round oil reservoir in tail and gasoline tank amidships

and average close to 280 miles an hour around the 300-mile Greves course in the 1938 races. Much of the time he has worked alone, fitting tiny braces into the one-piece, seventeen-foot wing or welding the tubular steel frame. Three months were spent on the wing alone, evolving slight changes in plans as the stubby wing took.

shape around its two main spars. The midwing plane carries the thoroughly braced, plywood and fabric-covered wing threaded through its fuselage like thread through a needle. The new model, Folkerts believes, will pick up twenty miles an hour speed with the addition of a metal propeller and a 400-horsepower streamlined Menasco motor. Only the propeller is outside the fuselage, the inverted, supercharged motor being encased in the streamline nose. Over-all length of the racer is twenty-five feet. The retractable landing gear is hand-cranked up beneath the pilot's legs. Oil tank and two small gas tanks are in the tail, for balance; an oil pump provides for circulation. The other two gas tanks are above the wing, in front of the eighteen-inch cockpit. Elevator surfaces are covered with plywood and fabric, but the rudder and fin have merely fabric sheaths. Folkerts has been designing and building airplanes since 1926, with racing models his recent specialty. Pilot Joe Jacobson, a veteran of the air races, believes he has a winner this year.

#### Five-Foot String Instrument Plays into Loudspeaker

This seven-stringed instrument has no sounding board but plays through electric amplifier

Lacking the traditional sounding board, a five-foot stringed instrument invented by an Oklahoma City musician plays through a loudspeaker. The seven steel strings span an open metal framework and are plucked, bowed or struck with cork hammers. Under each string is a magnetic pickup connected to an amplifier system so that the instrument can fill an auditorium with its music. By manipulating a volume control, a chord can be sustained for a half-minute. Rich new harmonies are possible with the instrument.

#### Heart of the Stars Is Heavier than Anything on Earth

There is nothing in the world so heavy as the heart of a star. If your watch were as heavy proportionately, it would scale almost a ton and you could neither carry

it around with you nor lay it down without wrecking the furniture. Scientists theorize that the reason for the great weight
of the material forming the core of some
stars is that the terrific heat and energy
inside the star breaks up atoms and drives
electrons from their central core. Stated
simply, matter is more compact, with less
waste of space, than on earth. If, for example, all the atoms in a 180-pound man
were broken up and all the electrons driven closer together, with no waste space
between them, the man would take up no
more room than the point of a pin.

#### Automatic Bridge Game Board Permits One Person to Play

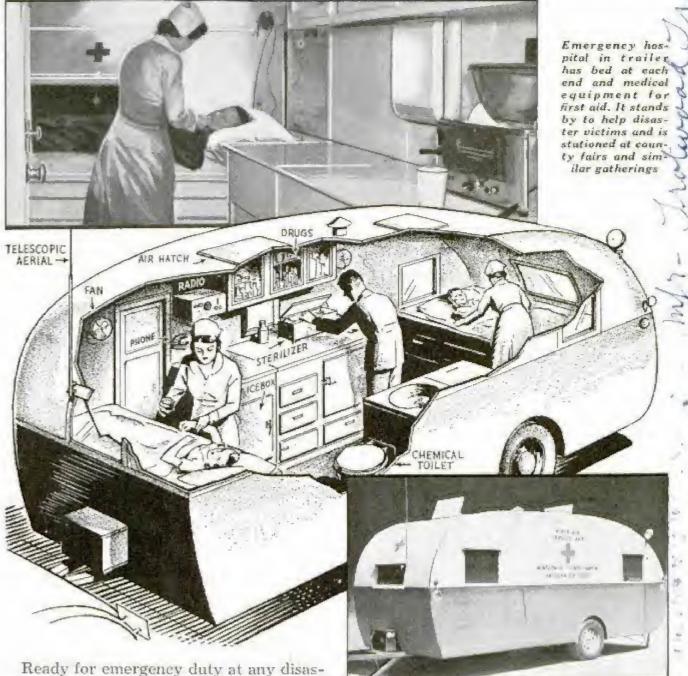

Designed so that bridge may be played by only one person, an automatic board has been introduced. The game is contract, played exactly as though the player were sitting in a four-handed game. The player bids and the board automatically makes bids for the three missing players. The player plays his hand and the Dummy and opponents put up perfect defense, through the board. The player sees only the cards he would in actual play, concealed and revealed trick by trick. Any mistakes are instantly detected and corrected by the board.

#### Two-Bed Trailer Hospital "Covers" Disasters

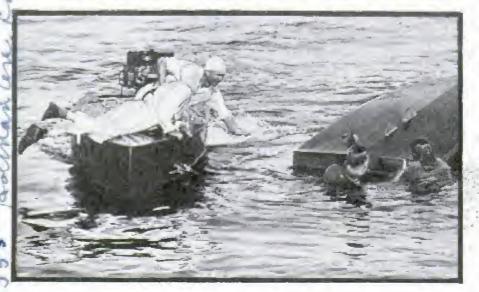

ter, answering all major fire alarms, and standing by to offer first-aid at county fairs, large picnics and similar assemblages is a trailer hospital equipped by the Montgomery county (Dayton), Ohio, chapter of the Red Cross. This mobile emergency ward has two hospital-high beds at front and rear of its conventional trailer shell; between them, an aisle flanked by a cabinet containing physicians' instruments and supplies, a sink, chemical toilet and storage space. Medical equipment includes an electrically heated sterilizer and distilled water. For communication, the hospital has a telephone and both long-wave and police radio sets. Five screened win-

dows, fresh-air hatches and fans provide ventilation. Stretchers and portable spotlight are ready for field rescue work. When the trailer is anchored, a fourteenfoot canvas canopy attaches at right angles to the door to serve as reception room, screened on its open sides. The tires are punctureproof, and the entire trailer, fully equipped, weighs 1,990 pounds.

## "GENTLEMEN DRIVERS"

Top, runabouts coming out of sharp turn, with mechanics sprawled across decks to help bank the boats. Bottom, rescue crew picking up driver and mechanic after a spill

much more standardized than in the past, driving skill counts more than ever. Records are falling every season.

In one of the speedy

In one of the speedy little boats you get all the excitement of a championship automobile race with a few extra thrills thrown in, at a fraction

of the cost and hazard. Forty miles an hour on the water seems faster than three or four times that speed on land. With the new premium on driving skill there's always a chance that a beginner will develop the judgment and daring necessary to win race after race and capture a national championship.

An experienced driver completely overhauls a new engine before he puts it in the water. Pistons, connecting rods, and other

Outboard boat racing is turning into an amateur sport and racers are competing for cups and glory instead of cash. On the Pacific coast no money prizes are being offered any more and in other parts of the country semi-professionalism is dying out.

The result is that more young men than ever are entering the exciting game of racing their high-powered "shingles" across the water. With engines and hulls Florence av. Los angeles

of the SPEEDBOATS

Top, driver and mechanic wearing helmets and life jackets. Note hand grip to which mechanic clings while balancing boat. Bottom, two hydroplanes riding high as they come out of a turn

moving parts must balance statically and dynamically. That makes the motor smoother and avoids breakdowns at high speed. Good drivers want their engines to run as cool as possible so they can set all the parts up tight. Small clearances reduce leakage past the piston rings. They use a "cold" alcohol fuel, cold-type spark plugs and increase the amount of cooling water that circulates through the engine

by opening up the water ports and using oversize water pipes. In races high above sea level fairly hot spark plugs are needed to fire the fuel.

The hand of a big clock provides the drama at the start of a race. When the five-minute gun sounds a black ball drops down a pole at the starting line. One more ball falls at the end of each minute. With one minute to go, the hand of a big clock

Top, various propellers used during season of racing. Circle, inspecting hydroplane bottom. Below, balancing pistons on scales

starts to rotate and the aim of each driver in the race is to hit the starting line "wide open and going away" exactly when the clock hand reaches zero and the starting gun goes off. If a driver reaches the line too soon he must circle back and start over. If he

hits the line a second or two after the gun the chances are that others will cross ahead of him.

Drivers have to be skillful at making two different kinds of turns. Depending upon the dimensions of the water, the course may be laid out with easy five-buoy turns or sharp one-buoy "corners." To get around one of the sweeping turns you shift your weight toward the buoys and depend on your weight to bank the boat around. In rivers or channels where the width of the course is restricted, one buoy marks a turn and to get around it fast you approach it at full speed, circle around, and double back. Good drivers hit these sharp turns with the same technique used on the race track.

"To get around such a turn at the fastest possible speed you approach the buoy with the motor wide open," says W. W. Downey, who has held several national cham-

pionships. "Almost parallel to the mark you jam the throttle shut, yank it open again, and at the same time spin the steering wheel over. Tripping the throttle like that helps put the boat in a slide. You skid around the mark broadsiding through the water. If you should try to steer around instead of going into a slide you couldn't hold the high speed and you would capsize.

"Most spills occur when the boats are coming out of a corner and are straightening up. A speedboat is under control just as long as you have power enough to keep shoving ahead but in a power slide a little too much rudder may overcome the push of the motor and flip the boat on its side. Even if you have judged the turn perfectly there is still a chance of capsizing, for you may hit some one else's wake at the wrong moment. That trips the bottom of the boat and over you go.

"If the fin that serves as a keel under the hull is wrenched off in a turn, you are going to have a wild ride. Without the fin the boat acts just like a car on a wet pavement and you skid and slide all over the course until the speed drops. Spills are expensive, and it may cost fifty dollars or more to overhaul your engine if water gets into it."

A spill happens so fast the driver is hardly aware of just what went on. Drivers are required to wear life jackets and rarely get more than a wetting when a boat tips over, although Downey once received a couple of broken ribs and a fractured skull when his boat "looped" and he fell back into the engine. A boat is apt to fall over backwards if a strong gust of wind catches under the raised bow. Race drivers equip their boats with a "deadman" throttle so that if their hand leaves the fuel control the engine stops, but in one collision, Downey's throttle control jammed and after he was tossed out the boat kept speeding wildly around the lake until it filled up through its broken timbers and stopped.

In a national championship contest a few years ago, the leading boat rolled over on a turn, spilling its driver, and then righted itself. The driver swam back to the hull, started the engine, and went on to win the race. That was possible because the other boats were barely able to keep going in the rough salt water that kept fouling their motors.

Proper preparation is the second most important thing in winning a race. The high-speed engines, literally packages of mechanical dynamite that wind up to 6,500 revolutions per minute, have to be tuned and adjusted just before every race because changing atmospheric conditions affect the carburction. A can of ether to shoot into the firing chambers and

Realistic display of aurora borealis produced by colored lights projected in arcs and beams on ceiling of Hayden Planetarium Northern lights "under wraps" shimmered and

Northern lights "under wraps" shimmered and danced recently on the indoor sky of the Hayden Planetarium. The planetarium scientists reproduced the aurora borealis with dramatic realism, brilliant streamers and arcs dipping and fading, changing color from apple green to glowing red. The demonstration was arranged during the epidemic of sunspots and magnetic storms which have attracted world-wide attention.

### Hydraulic Shock Absorber for Bicycle

Exact counterpart on a small scale of the shock absorber used on millions of automobiles, a hydraulic cushion is now available for bicycles. Mounted under the saddle, it smooths out the jolts of the road.

#### Electric Meter Tests Skin to Gauge Emotion

Emotions shown on faces in background are recorded by instrument sensitive to electric resistance of skin. Scientist is testing young woman

Call it an emotion meter, lie detector or what you will, an electric device contrived by Dr. D. Urich Greenwald at the University of Iowa draws a curve of your emotions as they run the gamut of joy, horror, fear, surprise, love. As you react to some stimulus that "gets under your skin," the electric needle reacts to emotional changes in resistance in your skin. Used by Dr. Christian A. Ruckmick in studies of emotion, this instrument is called a dermohmograph; derm for skin, ohm for electrical resistance, graph for its record on photographic paper. The scientists theorize that human emotion causes a piling up of positive and negative ions on the walls of skin cells, affecting resistance of the skin to passage of electricity. Essentially the emotion meter consists of dry cells, electrodes, fixed and variable resistances and a galvanometer. By reading the galvanometer while the subject watches a motion picture or reads a letter, his emotional reaction can be seen. For recording purposes, the deflection of the galvanometer guides a beam of light striking a moving roll of sensitized paper.

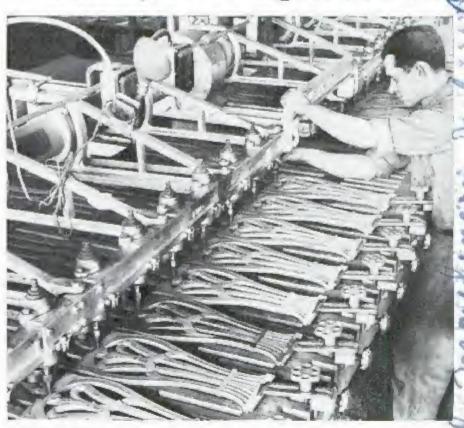

#### Dust and Water, Birds and Cats Are Blamed for Starting Freak Fires

"Fire of mysterious origin destroyed three business houses today at a loss of \$15,000." The mysterious origin turns out to be a cat that knocked a carton from a merchandise shelf to a lighted gas stove. Cats and birds, water, even sleet cause many a freakish fire. An eagle swooped down to perch on a power line, shorted the wires, burst into flames and dropped to the ground. Its blazing feathers set fire to

## Master Chairmaker Carves Twenty-Four Copies at Once

(a) Andrew Halbran

Following chair pottern with master spindle, operator automatically guides twenty-four other spindles which reproduce the carving in exact detail

One man operating a giant master carving machine can turn out, at once, twenty-four exact copies of any hand-carved piece of furniture. This multiple shaping tool is used to manufacture chair backs, legs or any piece formerly hand-carved. The operator simply clamps the original piece at the center of the machine and traces its design with a spindle, while twenty-four duplicate spindles automatically follow his hand motions and reproduce the carving. The machine is capable of very intricate and detailed work.

#### Canoes Are Carried by Airplane to Northern Waters

the grass and 100 acres of grazing land were burned

over. Occasionally a bird looking for nesting material picks up a lighted cigarette, and soon a fire starts under the eaves. Water is the enemy of flames, yet water acting on lime or other chemicals, or water acting as a lens to focus sunlightperhaps through a fishbowl-sometimes is the cause of a fire. Sleet and snow increase the forestfire hazard by snapping off branches, thickening the tangle of underbrush that speeds fire through the forest in summer. Dust explosions are a well-known fire hazard. Steam pipes close to wood may by daily heating reduce the wood to charcoal, and then it is easily ignited. A sheep huddled

## The TRUTH about TANK

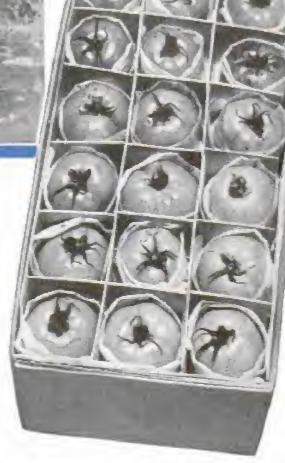

years ago, Dr. W. F. Gericke of the university conceived the idea that certain fruits and vegetables could be grown on a commercial scale by water-culture methods. In the greenhouse on the Berkeley campus, he produced giant tomato plants that had to be harvested from a stepladder, tobacco plants whose tops crowded the roof, and impressive yields of colorful flowers. One year an exceptionally good crop of potatoes was ob-

DURING the past few years, much publicity has been given to the growing of plants without soil. This agricultural science, since its inception, has been called by various names, including "tank farming," "tray agriculture," "chemical farming" and "hydroponics."

Most stories about water culture have left the impression that a startlingly new discovery has been made which will completely revolutionize agriculture. Water culture, however, is at least three-fourths of a century old. Since 1850 scientists have known that plants could grow and bear fruit in water containing nutrient salts, and hundreds of laboratory investigators have used water-culture methods to study nature's laws of plant growth.

At the University of California, plant physiologists have long employed water-culture methods in the laboratory in studying problems that beset the state's \$500,000,000 agricultural industry. Some

Choice tomatoes grown by water-culture method and, above, preparing a seed bed. Pine excelsior, pine sawdust or rice hulls can be used for this purpose

FARMING

tained in an outdoor experiment,

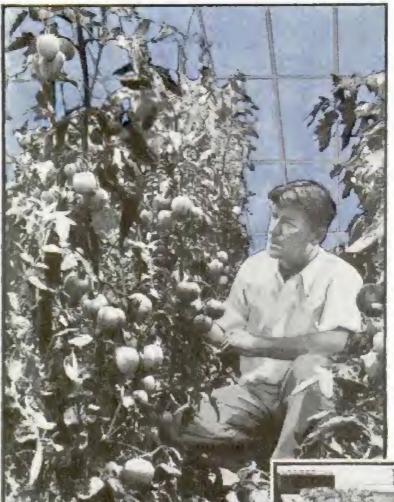

The novelty of Dr. Gericke's experiments fired the public imagination. The passing of the oldstyle dirt farmer was predicted; "skyscraper gar-dens" were foreseen for city dwellers; and it was even rumored that a chain of New York restaurants was growing its vegetables in the basement. These predictions and rumors had little basis in fact. A Sunday newspaper supplement pictured a pretty young housewife harvesting tomatoes in her kitchen. The vines were growing in a small tank in the pantry. For illumination there were a few feeble electric lights. A pretty picture-but not scientific!

Water-culture tomatoes being sized and packed for the market. The crop is harvested continuously from January to August, when field-grown tomatoes are not on the market. Below, asparagus at left received correct nutrient balance while that at the right did not

233

mental laws of plant growth and fruit production are the same whether the plants are grown in chemical solutions or in the soil. In either case, certain factors are essential including favorable temperature, humidity and illumination, an adequate supply of water, and the necessary mineral salts and oxygen for the roots. Plants cannot grow in dimly lighted places such as basements, where they would not grow in soil.

At present, the tomato is the chief commercially grown water-culture crop but only a few water-culture tomato greenhouses are operating. Other crops under experimentation include lettuce, asparagus, tobacco, potatoes, cucumbers, string beans, peas and melons. The cost of equipment and operation will probably limit the use of water culture to high-

Part of the misconception of water culture has arisen from confusing two different lines of experiments at the University of California. One is Dr. Gericke's development of large-scale, commercial methods of growing tomatoes, tobacco, potatoes and flowers by water culture. The second is the study of laws of plant growth in specially controlled chambers under varying condi-

tions of temperature, humidity and artificial illumination.

The growing of plants in chemical solutions has been hailed as a "marvel of science." The growth of plants is indeed marvelous—but no more so when grown by the water-culture method than when grown in soil. Commercial "tank farming" rests upon no newly discovered principle of plant nutrition. It is merely the conversion of a laboratory technique to a large-scale, commercial basis. The funda-

Lettuce plants, below, supported in corks which are placed in holes drilled in metal covers. Above, harvesting water-culture tomatoes

priced crops grown out of season in greenhouses.

The equipment for commercial "tank farming" consists of long, narrow, shallow tanks. They may be constructed of wood, cement or black iron. To prevent toxic substances from getting into the solutions, the tanks are coated with asphalt paint or some other cheap, non-toxic material. Wire screens are placed on top of the tanks. These screens support a layer of bedding material three to five inches thick, de-

pending upon the kind of plant grown. This material may be prepared from pine excelsior, pine sawdust or rice hulls. Some materials—especially redwood—contain toxic substances and should be avoided.

In the moist beds, seed is planted or young plants are set out. The roots develop not only in the solution of the tanks, but also in the bedding material. The shallow tanks and the porous nature of the beds permit good aeration of the root system.

Thousands of requests have reached the University of California for a nutrient solution formula. But nutrient solutions for water culture are no closely guarded secrets. You may find the formulas in any plant physiology text. Plants show a marked adaptation to different nutrient solutions —just as they are able to grow in many kinds of soil. Therefore a fairly wide range of concentrations and proportions of the salts can be employed. Circulars published by agricultural\_experiment stations contain various formulas.

Once the plants begin to grow, they require expert attention. As the nutrient salts are absorbed by the roots, the composition of the solution gradually changes. Plants use up some chemicals faster than others. Accurate tests should be made at intervals, and the proper adjustments made. In fertile soil, many of these adjustments take

Spray Gun Uses Stain Again as Drippings Drain in Pan

Excess stain drains from chair to perforated circular drip pan and flows back to tank for use again

Furniture makers are adopting a lowpressure spray gun which saves excess
stain by collecting it in a perforated drip
pan which sends it back into the tank for
re-use. The quarter-horsepower motor and
bronze pump builds up only ten pounds
pressure so that the stain is applied in a
coarse spray giving a fuller coverage, and
eliminating the loss of a fine spray in the
atmosphere. As little as five gallons of
spray can be used in the tank, reducing the
fire hazard of the large dip tank.

#### "Merry-Go-Round" Bullet Test Shows Up Unbalanced Ones

Bullets that are not exactly balanced won't spin smoothly. A cartridge manufacturer uses this

principle in an electric tester that separates perfect from imperfect bullets. It is a dish placed above three magnets so arranged as to concentrate their field in a small area, exerting a pull on the bullet that makes it spin on its nose. Imperfect bullets tend to wobble, showing even the slightest error in balance.

#### Floor Magnets Collect Metal from Dust of Factory

To safeguard a New Jersey steel plant from explosions in its exhaust stacks, magnets have been installed on the floor at the exhaust intake to sort out

1521

any metal fragments. Dirt and sawdust are drawn into the ducts, but metal objects gather on the brass plate beneath which are four permanent magnets.

#### Ultra-Short Wave Radio "Horn" Sends Pencil-Like Beam

Somewhat resembling a primitive phonograph, an efficient ultra-high frequency radio transmitter developed by Dr. Wilmer L. Barrow at Massachusetts Institute of Technology is expected to prove valuable in micro-ray communication and in airplane and ship navigation. Its square-faced electromagnetic horn "antenna"

High-frequency waves started from square tube behind horn are shot forward in narrow beam

sends a narrow pencil-like beam of radio waves only a few inches long. The waves are started from a square, hollow tube behind the throat of the horn.

#### Glass Case Protects Baby from Poison Gas

Masked nurses clad in gasproof rubber garments are testing out the latest invention of war-fearing Europe. It is a portable glass case in which babies can be thrust at the alarm of a gas attack and carried to a zone of safety.

#### Profit for Farmer in Drugs Now Being Imported

American farmers may find profit in raising some plants which are the basis of crude drugs now imported to the extent of \$8,000,-000 a year. Dr. Perrin H. Long, of Johns Hopkins University, points out that United States soil and climate are favorable for producing licorice, mahuang (ephedrine), castor beans and tragacanth, now imported from Russia, China, Brazil and Persia. Licorice grows as a weed in the southwest, and mahuang is cultivated in North Dakota. Dr. Long observes that hand cultivation here would make costs too high compared with cultivation abroad, but science and industry may develop machines which would make it possible to produce these crops profitably.

Here is a "full dress" rehearsal of a gas attack in Europe, with attendants dressed in gasproof rubber suits sealing baby in glass case for removal to safety

#### Windows in Builders' Fence Permit Public to Watch

Passersby are shown watching construction crew, safe behind the window built into fence around the building project

which the public takes in watching others work, a construction company built windows into the fence around the job on which its employes were working recently. The windows permit passersby to watch, in complete safety.

Two gears in the shaft drive of the "Mauretania," new Cunard-White Star liner, will be fortysix feet in diameter and have 500 teeth.

#### Suction Cups Grip Tray on Serving Stand

Four upturned suction cups on wrought-iron stand give a tight anchorage to tea tray

Serving trays cannot slip off a wroughtiron stand just brought out. At the top of its four posts are suction cups which take a firm grip on any tray set down, preventing any upsets from jarring. Any size tray can be used on it.

#### Copper-Wheeled Soldering Iron for Sealing Packages

With a copper wheel in place of the conventional tip, a soldering iron has been developed for sealing packages and "tacking" thin sheets of material together by heating. Certain sheet packaging materials such as rubber are adhesive when heated. The wheel can be smooth-faced

"Welding" a parcel with a wrapping material which is sealed by the copper wheel of the soldering iron

for attaching photographs to mounts with dry-mounting tissue, pressing corners and edges together; or it can be ridged so that the sealing action takes place along a series of narrow lines. The iron operates through a 150-step rheostat controlling temperature to close limits. A conventional tip can be installed for ordinary soldering.

### "Front-Drive" Pipe Connector 2 Installed Outside the Tank

Attaching pipes to containers without any shutdown for draining and flushing tanks is facilitated by a "front-drive" pipe connector which is installed from the outside. One op-

"action nut" a turn and have the line ready for connection in five minutes. It can be used on water, air, gas, steam or oil lines and will withstand high pressure.

### Centrifugal Juice Extractor. Does Its Job Quickly

This juice extractor works rapidly, producing a glass of juice in about one minute

Using centrifugal force, a new electrical fruit and vegetable juice extractor does its job almost instantly, leaving the pulp nearly bone-dry. A glass of apple juice is produced in about sixty seconds and a glass of carrot juice in a few seconds more.

#### Tubes Filled with Air Eliminate Tent Poles

Air-filled tubes replace poles as supports for the latest tent. The tubes may be inflated quickly for erecting the tent or deflated easily for packing. The four tubes are connected and are blown up from the same valve. The tent is large enough to accommodate four or five.

#### Steel Rail at Center of Road Prevents Head-On Crash

White center lines on the highway warn motorists to stay in their own lanes, but they don't prevent a crash if someone ventures across the line at the wrong time. Real protection is now offered by a center-line guard rail of convex steel strips supported by spring-steel posts, sturdy and resilient enough to absorb the shock of impact and deflect the car back to its proper lane. This traffic divider occupies no more space than is taken by the double white line.

10 th and

Top, inflating the tent's air tubes. Bottom, the tent in use. Inset, tent folded and being carried to a new location

Kept from colliding head-on at center of the highway, two cars carom off from convex steel guard rail

#### Miniature Pressure Gauges Built to Scale for Models

Miniature pressure gauges, some no wider than your little finger, are available for model makers. Exact copies of the gauges used on real engines and machinery, they are manufactured

to register any levels of pressure the model builder desires and use the Bourdon tube transmission system.

#### Sculptor Performs Dental Job for Model of Tyrannosaurus

Sculptor Sullivan is seen here giving a set of teeth to the concrete image of Tyrannosaurus Rex in a Rapid City, S. D., park

Dentist to the monsters of "Dinosaur Park" at Rapid City, S. D., is part of the assignment E. A. Sullivan drew as sculptor of the images of prehistoric beasts in this strange outdoor exhibit. Here

Mr. Sullivan is installing a set of teeth in the huge jaw of Tyrannosaurus Rex, one of the colony of steel-and-concrete reptiles and animals.

Home Kept Hot or Cool by Fluid

Circulated in Radiators

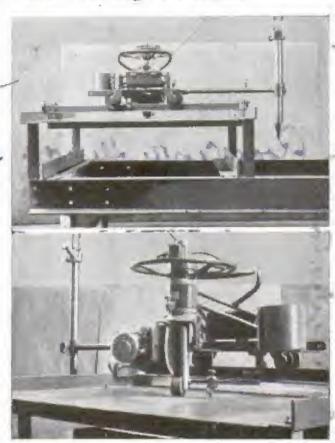

Serving the dual purpose of heating the small home in winter and cooling it in summer, a radiation system just developed circulates a water-sodium-lactate solution in a "closed" circuit of small copper tubing. In winter the basement coils are heated by an oil burner, the solution permitting a temperature of 240 degrees Fahrenheit, and even higher since the heating system is under sixty pounds pressure. In summer the solution by-passes the heating coils and is cooled by a refrigerator unit to about twenty-eight degrees at the refrigerator. A pump keeps it in circulation. The radiators are cabinets eighteen by thirty by eight inches, consisting of copper coil providing 100 square

feet of radiating surface; near the base is an electric "squirrel-cage" fan drawing air into the front of the cabinet to escape through a latticework top. A drip pan underneath gathers moisture precipitated from the air in summer. Installation costs not much more than a heating system alone.

5 milden, Colo

#### Metal-Cutting Tool Built by Shop Owner

At a cost of only about \$200, a Colorado machine-shop owner built himself a metal-cutting machine light enough to be moved to any part of his shop, and saved himself about \$3,000 under factory prices. The cutter will slice through eighteen inches of metal. In operation, half of the cutter is suspended over the metal to be cut; the other half is above a small iron plate where the designs are placed. The two parts are so coordinated that when the "tracer" part is moved over the pattern, the intense heat of the flame cuts the design in the metal.

Light enough to be moved about from one job to another, this machine cuts through eighteen-inch metal.

#### Aircraft Carrier "Enterprise" Joins the Navy

Official U. S. Navy photograph

Port broadside view of the United States navy's newest aircraft carrier, the \$21,000,000 "Enterprise," as the big vessel was placed in commission at Norfolk navy yard recently before her "shakedown cruise"

Latest recruit to the rapidly growing United States navy is the aircraft carrier "Enterprise," a formidable addition to the air arm of the sea forces. This gigantic floating airport cost the government \$21,-

000,000. Formally placed in commission at the Norfolk navy yard, the ship was ordered to proceed to southern waters for a shakedown cruise before threading the Panama Canal to join the Pacific fleet.

#### Alarm Wakes Drowsy Driver When Hand Relaxes Grip

Small ring is held away from steering wheal by springs, and sounds horn it driver's grip relaxed

Like the "dead-man control" that halts the passenger train when the disabled engineer relaxes his grip, a safety device for the motorist sounds the horn as an alarm and shuts off the ignition if he dozes at the wheel. A metal-reinforced rubber ring is attached just below the steering wheel. After the alarm key is turned to "on," a slight pressure on the ring is required to keep the alarm from sounding. If the driver nods or is inattentive, springs push the ring away from the steering wheel and the alarm operates. On parking the car, the key is turned to "theft" and any attempt to move the car will sound the horn. un wanted

#### Molten Bronze Is Joined to Steel with Bond That Cannot Be Severed

Development of a method of uniting bronze and other copper alloys with steel is announced by an Ohio manufacturer. Although the joint is not welded, it is so firm that the two metals cannot be split apart. The bronze is molten when applied to the steel. This process is being used for making bronze-faced rolls, machinery slides and other products requiring the strongth of steel and the wearing and corrosion resistant qualities of copper.

Small block shows a permanent bond of steel and bronze, the bronze being molten at time of application.

## RAISING RABBITS

Top, mother and two young rabbits. Bottom, shipment of rabbits ready for market

hobby, but now many people are devoting all their time to the small animals. Small initial capital, the small amount of space required, and the rapid development of rabbits to market size are factors that have stimulated the industry.

To get into the business you should first investigate marketing arrangements in your area. In some places slaughter houses that specialize in rabbits call for the live animals when they are ready. In other localities you arrange with a butcher to handle the output of your hutches. Domestic rabbit flesh is a delicious, tender meat comparable to breast of chicken.

Successful raisers estimate that it costs about seven cents per pound to raise rabbits commer-

cially, but this figure is apt to vary depending on the price of grain. Returns to the raiser usually run from fourteen to sixteen cents per pound live weight. Although rabbits thrive in cold weather the biggest profits are made in southerly states where the mild winters permit breeding four times a year. Profits depend a great

RAISING rabbits for the market is a back-yard industry that has grown to million dollar proportions in the last few years. It is estimated that rabbit owners are receiving five million dollars annually from meat and fur, with the demand still going up.

In the past raising rabbits was simply a

## for PROFIT

Top, hanging up pelts stretched for drying. Bottom, good commercial New Zealand, with short ears and legs. Small heads also are preferred

deal upon starting out with a good breed.

"Most commercial rabbit men specialize in the white New Zealand rabbit." says D. Monroe Green, president of the National Rabbit Institute. "This type has a desirable white fur and has been developed by scientific breeding into a fine commercial animal. It commands a higher market price than do varieties that have a lower percentage of usable flesh. A good white New Zealand should have a low set body, deep shoulders, and short legs, neck, and ears.

"One mistake beginners are apt to make is to start out with poor stock. Good breeding stock costs five dollars per animal and up. A few superior animals can be the nucleus of a large and growing group of rabbits. Young does that show promise can be held from the market and added to the breeders. A good doe should be expected to earn at least six dollars pet in

33 lsenva

243

marketable young after all expenses every year."

A doe can be bred at the age of six months and may be bred four times a year thereafter. The young are born within a month's time and from six to eight are saved out of each litter. The young animals are ready for the market at the age of two months, when they should weigh approximately four pounds. Butchers like all the animals to come within half a pound of that weight.

Without help and with the right equipment, one man can care for about 500

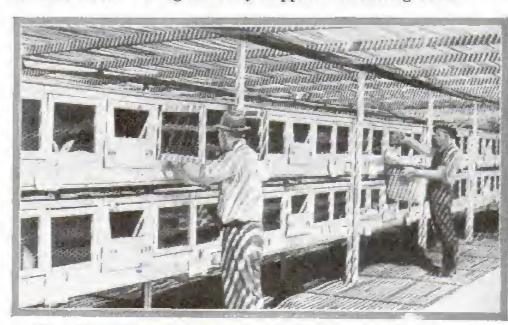

breeding does, although most people who are raising rabbits keep a smaller number and take care of them as a part-time occupation. One woman who started in three years ago with five does and one buck now maintains 100 working does in backyard hutches. A few hours work per day brings her a steady income of from forty to fifty dollars per month.

"In the first place," Green explains, "one should prepare a proper place in which to keep

the rabbits. The small animals need plenty of light and fresh air. They should be protected from heat and moisture. In the south the hutches may be kept under a simple roof but in the east and north the lower half of the walls of the rabbit house should be boarded in, leaving the upper part of the walls open except for canvas curtains that can be dropped during rain and storms. The animals need a protective roof even during the summer because their fur coats shouldn't be exposed to hot sun. In hot weather a sprinkling system on top of the roof will help lower the temperature under it. A dirt or concrete floor under the hutches is best.

"The individual hutches should have ten square feet of floor space. Standard dimensions are four feet

long, two and a half feet wide, and two feet high. The top, back, and ends should be built of boards if you live in a section having a cold winter climate, while if the climate is mild the top and back may consist of one-inch wire netting, allowing better circulation of air. The floor of the hutch should consist of five-eighths-inch mesh metal hardware cloth or netting, so that droppings can fall to the floor and be swept away. Consistent and complete sanitation is of the first importance. The hutches should be suspended about four feet above the ground by supports extending down

Top, filling galvanized iron feeding rack with chopped alfalfa hay.

Bottom, part of large rabbitry near Los Angeles

from the roof as a protection from other animals. When eight or ten weeks old young animals have to be placed in individual hutches to prevent them from fighting.

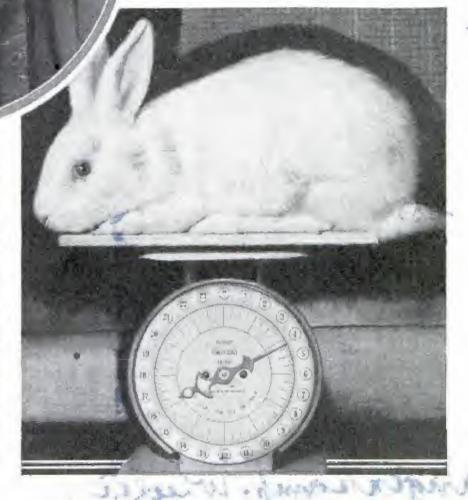

"A two-compartment hutch saves time in feeding. The two full-size compartments are divided by a wiremesh feeding rack into which hay and other greens may be placed, permitting both rabbits to reach the same

Top, food pellets for the rabbits. Circle, inspecting the animals. Bottom, two-month-old rabbit at the weight considered ideal for the market

food supply. A trough below the rack is provided as a place for hard foods. Nest boxes in which the does may raise their litters should be eighteen inches long, twelve inches wide, and thirteen inches high. A round door at one end should be seven inches in diameter, raised five inches from the bottom of the box. That will keep the young from climbing out until they can take care of themselves. The nest box should be roofed in cold weather and both the top and the bottom should be

#### Contact "Mike" on Violin Helps Deaf Player

Wire from contact microphone on violin carries sound through amplifier to deaf person's earphones

Deaf persons gain new enjoyment and greater skill in playing musical instruments by the aid of a contact microphone which reproduces the vibrations of any instrument to which it is attached-violin, guitar, piano, and even the winds-trumpet and clarinet. The unit is connected to the instrument, and the sound is fed through a small amplifier to the earphones or bone conductor. The entire musical range is reproduced without distortion or annoying peaks.

#### Suction Pump for Clogged Drain Injects Chemicals by Hose

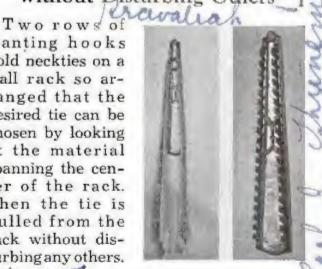

Strong solvents can be used to clear out clogged drain pipes without danger of hand burns or inhalation of fumes, by means of a suction pump just developed. It is first used mechanically

to pump the drain partly clear. Then the solution is placed in the container and introduced through a hose, sealed airtight to prevent escape of fumes or solution.

#### Necktie Chosen from Wall Rack without Disturbing Others

slanting hooks hold neckties on a wall rack so arranged that the desired tie can be chosen by looking at the material spanning the center of the rack. Then the tie is pulled from the rack without disturbing any others.

#### Ten Million Volts of Lightning Cost Twenty Cents on Meter

Lightning does strike twice in the same place—in fact, it strikes five to ten times in a fraction of a second, one stroke on top of another. If you were charged for a sin-

Half-million-volt lightning stroke is seen at top; flash occurs on pole as arrester grounds bolt

gle stroke on your house electric bill, the meter would show you had bought about twenty cents' worth. And the energy from that stroke would be that of a thirtypound shell fired from a gun with a muzzle velocity of 2,200 feet per second! These are some of the interesting facts developed by scientists "playing" with lightning. The other day Westinghouse engineers shot a man-made bolt from a half-million-volt lightning generator into a wooden pole, and another bolt into a transmission line illuminating a toy house in a display. The pole exploded into splinters. The lights in the house went out. Then the engineers put a lightning arrester on the line and repeated the demonstration: the lights didn't even flicker, for the lightning flowed off to the ground through the arrester. To build up the 500,000-volt artificial lightning, a rectifier stepped up the ordinary 110-volt supply to 100,000 volts and changed it to direct current. Then the rectifier charged five condensers in parallel, shooting 100,000 volts into each set of aluminum foil plates, and thence the electricity emanated in series so that the entire-500,000-volt force formed a small length of actual lightning. With the aid of a special camera, the scientists have found that natural lightning strokes are only about four inches, in diameter.

#### Healing Ray Focuses Power on Afflicted Portion of Body

Extension tube from short-wave therapy machine focuses healing rays on patient's neck without affecting other parts of body

Ability to train the healing power of short waves on the specific organ or part of the body affected by disease is claimed for a machine used by a noted Paris physician. Thus the treatment can be applied without affecting other organs. If his findings are accepted by the medical profession generally they may increase vastly the use of the healing rays.

#### 'Winter Garden' Shelf Hung without Marring Woodwork

Shell for potted plants, with its chromium rail, is attached to window till without screws or nails

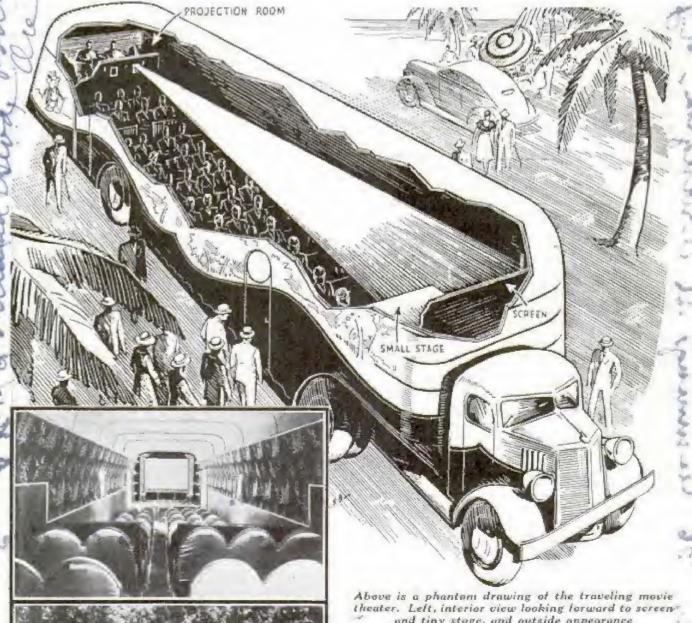

Without using screws or nails and without marring the woodwork, a portable "winter garden" shelf can be fastened quickly and simply to any window sill. The shelf is nine inches wide and either eighteen or twenty-eight inches long, made of three-ply birch enameled in various colors with a chromium guard rail. It does not interfere with operation of the window.

There were 69,700,000 radio sets in use around the world at the end of 1937, an increase of 6,250,000 in a year.

date movies against a rolling screen. If power lines are not handy, the plant can furnish its own 110-volt current. Electric fans have been installed.

#### Television in Natural Colors Offered by New System

Natural color television images may be sproduced by a system on which a patent 🦛 has been issued. The method relies on superposition of primary colored images to achieve the desired effect. Color filters and suitable lenses break up the scene to be style chairs, which are permanently fixed. \* televised to produce one image for each of the basic colors. These images are then directed at a special scanning disk to be converted into electrical signals for radio

# Jr. Whole Plant MECHANICS

transmission. At the receiving end, the signals are converted into light signals in a similar manner, except that the process takes place in reverse. Separate primary color images are then combined to produce the colored image. The method employs a mechanical scanning disk, no longer in general television use because of serious mechanical difficulties.

#### Metal Miter Box for Home Shop Set Quickly for Any Angle

Its index plate marked for cutting angles from zero to fifty degrees, a metal frame

miter box is offered the home workshop owner. The box can be set quickly for any angle of cut. Its back is cut away so that the work can be held easily

while sawing, and the adjustable bench stops hold the box in position on the workbench when the box is being used.

# Grinder Mounted on Fender Is Powered by Car Engine

With his grinder mounted on a plank bolted to the fender of his automobile, a Nebraskan travels from town to town sharpening shears and knives. The various emery wheels take their power from a belt connected with the fan belt shaft.

Sharpening tools and knives with grinder run by belt connected to fan belt shaft of automobile

#### Dog Has Private Entrance in Lower Panel of Door

This dog doesn't have to bark or scratch the door to get in. He has his own double-hinged entrance

There is a strictly private entrance for the pup at Tod Oviatt's home in Burbank, Calif. In the lower panel of the screen door has been fitted a small door for the dog, kept shut by a coil spring and equipped with double-acting hinge. Noiseless, it lets the dog come and go without the bother of opening the main door.

#### Wooden Duck's Wings Move When the Wind Blows

When the wind blows, a wooden duck, mounted atop a pole in Tuksa, Okla., flaps

its wings in realistic manner. The duck's body and head are carved from a single piece of wood and painted. Mounted on an eccentric axle

which permits them to rise and fall and to move back and forth, the wings actually move in a flying motion closely approximating the flight of a real duck.

# THRILL HUNTERS

Scene in a National Broadcasting company studio, with the audience listening while an orchestra puts a program on the air. Thousands upon thousands of people attend radio performances daily

#### PART II

WHEN radio was in its early days, the idea of a comic strip of the air, a tenminute skit based on the lives of two characters and broadcast every night at the same time, was developed through a Chicago station.

It was desired to pattern the series after the newspaper feature, "The Gumps." Two professional singers were commissioned to work up the idea. One of the team confessed he knew nothing of the ups-and-downs of married life and suggested a program built around two Negro characters. The station manager agreed and in January, 1926, Freeman F. Gosden and Charles J. Correll made their bows as radio actors. That was the beginning of the radio serials.

Today, the air lanes are filled with continued stories. There are daily capsules of

Land I be.

romance, mystery, comedy and adventure; serials about married couples, young lovers, detectives, rustics, newspaper reporters, stage and screen life, the foreign legion, aviation, the circus—virtually every romantic locale and exciting occupation has been exploited in radio continuities.

Despite the mushroom growth of the strips, Gosden and Correll, as Amos 'n'. Andy, are still doing business. More than 3,200,000 radio sets are tuned to their program wave length each day they are on the air, a recent survey shows. As they broad east five nights a week this means a week ly audience of 16,000,000 sets. No program series has ever before garnered so many listening ears. Their years of microphone service have been highlighted with the portrayal of more than 190 different char-

# of the AIR LANES

Tap, cast of "Carol Kennedy's Romance." Bottom, Correll and Gosden holding Amos 'n' Andy scripts

acters. Not until a year or so ago did anyone appear with them on their show.

Gosden and Correll started out as Sam 'n' Henry. For a week or two they devoted their afternoons to the job and then, for almost two years, the sketches were written one hour before the broadcast. Frequently they would repair to a room adjoining their studio at 9:30 o'clock and twenty minutes later would emerge with a 1,500-word script. Their late morning and early afternoon hours are now given over to preparation of their material. When the task is finished, two copies are made, one being sent to Washington to be copyrighted and one is placed in the files. In their office are bound volumes containing every word they have written.

Amos 'n' Andy broadcast alone, without audience. They permit no one in their studio or to watch them from the outside.

Where do radio scripts originate? The big successes have come out of the imagi-

Left, radio director amused at a script rehearsal. Right, cast of Myrt 'n' Marge makes last-minute change in scripts under direction of Stuart Hawkins, producer of the well-known serial

nations of persons who have had little or no formal training. The fifteen-minute programs have baffled famous dramatists and fictioneers and yet, aviators, college boys, housewives, and retired troupers have been successful in creating little worlds of mythical characters who have become real personalities to millions.

Chester Lauck and Norris Goff, pronounced Lum and Abner, were corporals in the ranks of business in Mena, Ark., before they started in radio. Lum was manager of a motorcar finance company and Abner secretary of a wholesale grocery company. On a special program given by a luncheon club over the radio, the pair gave a skit in which they mimicked some of the home folks with whom they were doing business. After that, they were spoiled for any other work.

Myrt 'n' Marge are classical examples of fictional people who have followed almost entirely the personal adventures of real ones. During the depths of the depression, Myrtle Vail was living in Chicago as a housewife while her daughter, Donna, was dancing in a night club. She tried her hand at writing a script based on her experiences in the theater. She sold the idea to a large company and then began weaving her experience as a stock, vaudeville, and musical comedy player into the radio series of a mother and daughter seeking success in the theatrical world.

Many famous characters of the air lanes have never lived at all. Carol Kennedy is a composite creation, a fusion of many wealthy society girl types observed by Marie Blizzard during her many years of reporting. Big Sister was the outgrowth of a remark made by the late Arthur Brisbane to Lilian Lauferty. The columnist admired Mrs. Lauferty's mother, a Boston social worker, and remarked: "With a mother like yours, you ought to be able to Big Sister the world."

An ex-schoolteacher, Irna Phillips, writes three five-times-a-week scripts at once, a job requiring approximately nine hours of dictation daily and netting over two million words a year.

Once a character or group of characters are born, a plot is created around it or them. The general plan is to have the story reach a high pitch of excitement at the end of the week so the audience's interest will carry over to the week following. The serials must be planned several weeks ahead. However, as soon as the characters become set in their creators' minds the stories almost write themselves. Some character injected into a script for a few words sometimes provides material for two or three months' adventure. With a thousand complicated details of plot and character on their hands, the radio creators must be very particular about keeping an accurate record of what has happened. If they do not, listeners lose faith and interest, Some keep full biographies of every one who has ever appeared in a script and have a complete map of where the action takes place.

Because the audience is alert to "boners," the program makers spend considerable time in research when they are dealing with specialized professions and types. A program depicting a doctor's life necessitated the radio creator spending several days a week at a hospital, taking notes on the routine and talking to nurses and doctors.

Several weeks before a radio serial takes the air lanes, it is cast. It's an important task because more than half a show's reality depends upon finding good characters. They are the ones who

bring the warmth of the human voice to the written line and the little tricks of speech that establish the personality.

Many auditions are held to find the right voice, the right face, the right personality. In the case of Arlene Blackburn, who was selected after many auditions for the role of Pretty Kitty Kelly, an Irish girl with amnesia, even hair counted. Her auburn tresses were one of the main reasons for her being selected for the role.

Over the air, the script must sound as natural and unhurried as life. To obtain this effect, the script must be rehearsed carefully and timed to a split second. This involves exceptionally good cutting and skillful direction. The producer and script man must work hand in hand. A director will ask the writer about a cut, making certain no necessary pivotal points or clues are omitted for

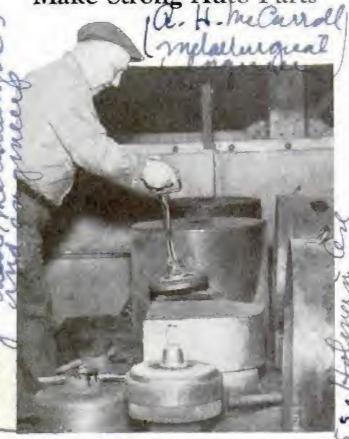

Top, Lum and Abner on the air. Center, Michael Raffetta, N.B.C. actor in "One Man's Family." Bottom, Director Charles Martin and a cast of radio actors caught in a tense scene

Whirling Molds for Metal Make Strong Auto Parts

Turning out stronger steel parts for the automobile industry in centrifugal casting molds

Molds that spin at 600 to 800 revolutions. per minute are being used to cast stronger The centrifugal casting turns out a lighter weight product and is economical, since, the metal is brought directly from melting pot to mold while forging requires the metal to be heated three or four times. Extra strong gear blanks, free from blow holes and shrinks are produced in three minutes in the whirling mold.

#### Fly Ash" Trouble Cured by Control of Fire

Constantly "feeling" the fire and balancing air delivery, a simplified mechanism is designed to control "fly ash" at its source in stokers. Measuring twelve by nine by six inches, it does not permit a sudden blast of air when the fan starts, but holds it in check until the fuel bed has reached a proper density. After the fuel bed has been established, the air is further retarded and slowly admitted to the fire so that combustion temperatures are stepped up

moderately. By this means, the loose ash is restrained until it forms into a solid clinker. The action eliminates formation of "coke" trees by creating better combustion. The device also acts as a counterbalance should the fuel bed become too thin during stoker operation, which might develop a tendency to blow out degenerated ash. The apparatus shuts down the air. supply and slowly starts to rebalance it. 052

Airplane Speed Indicator on Car Promotes Fuel Economy

12 aug. 1 Motorists who govern their driving rate on long trips by the air speed instead of ground speed may better their fuel consumption by two miles per gallon. This can be done by using an airplane-type speed indicator, with the pitot tube on the radiator or any convenient position and the dial on the instrument board. When driving into a head wind, the air speed may bregister much higher than the ground speed. By driving constantly at an airspeed reading of fifty-five miles an hour, the tourist can take advantage of tail winds that may boost the actual mileage rate on the speedometer; and on encountering head winds he merely keeps to the fifty-five mile air speed and avoids part of steel parts for the automobile industry. The fuel waste in bucking a high wind athigh speed.

points to the airplane-type air speed indicator mounted on front of automobile

# Toy Airplane Performs Stunts around Pylon

The entire family has fun with this captive stunt plane which spirals, stalls and climbs and loops around the weighted aluminum pylon. Notice the control box in "dad's" hands. Below, a closeup; the motor counterbalances the plane when in flight

By varying its speed through a rheostat button, a toy airplane can be made to loop-the-loop, spiral, stall or zoom around an aluminum pylon. The "radioplane" whirls in a full circle and maneuvers up and down approximately 100 degrees. Chromiumplated tubing which connects motor and plane through a universal joint houses a flexible drive wire, the motor being mounted as a counterbalance to the plane.

#### Armored Car Flies Colors of Motorized Cavalry Troop

There's plent in the mechan cavalry meant color guard whorsemen; toda Cavalry regime

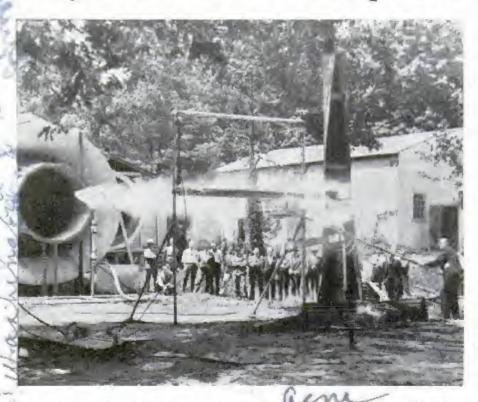

Machine gunners on motorcycles escort car carrying regimental colors

There's plenty of power if less romance in the mechanical cavalry troops. When cavalry meant soldiers on horseback, the color guard was a dashing display of horsemen; today the national and First Cavalry regimental colors fly from staffs

attached to an armored car, and their escort is a pair of motorcyclists riding behind submachine guns.

(Names and addresses of manufacturers and dealers in articles described in this magazine will be furnished by our Bureau of Information upon request accompanied by stamped envelope.

# Wind Tunnel Test Ends Peril of Fire as Plane Dumps Gas

As dump valve releases gasoline in air blast from wind-tunnel blower, man at right touches it off with sparks from long pole

Dumping gasoline to lighten the load of a plane in flight has always been a hazardous operation, but safety engineers of the U. S. Bureau of Air Commerce believe they have found a way to eliminate the fire peril. They used the giant wind tunnel of the Bureau of Standards to simulate flight conditions. Releasing a gasoline dump valve over a blast of air from the wind-tunnel blower, they lit the volatile gas with sparks from a rod. But as soon as the rod was withdrawn the rush of air blew out the flames. The engineers theorized that if gasoline can be dumped directly into the slipstream of the propellers, without striking any of the plane's surfaces, the air will prevent or put out any fire.

#### Air-Jet Pulverizing Chamber Grinds Powder Superfine

Multiple jets of air of superheated steams shot into the walls of a pancake-shaped chamber supply the force of a pulverizing machine that grinds particles, economically, to a size corresponding to 2,500 theoretical mesh, or five microns—about two ten-thousandths of an inch. Particles one-sighth inch in diameter are placed in the unit and the jets, at pressures of 100 to 500 pounds per square inch, cause the material to whirl and grind itself by impact

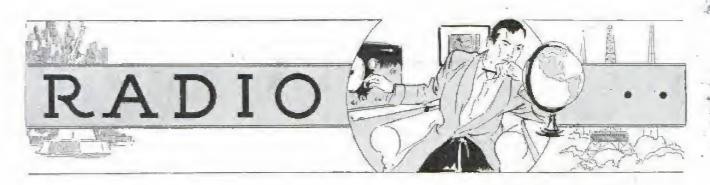

into almost pheroscopic powder. Its industrial use will be in manufacturing finer face powder at low cost, mineral fillers for writing paper, fine insect and fungicide powder, paint and rubber pigments and powder for manufacturing plastics.

#### Pedal Lifts Cutter of Lawn Mower to Avoid Rocks

Controlled by the operator's feet, a "floating" type cutter on a power lawn mower can be raised to avoid rocks and similar lar obstructions. The mower is in use on the campus of Kansas State College. Its cutters are the whirling suctionblade type, operating at speeds from 1,800 to 5,000 revolutions per minute. It has three forward and one reverse speeds, those forward ranging from one to five miles per hour The six and one-half horsepower motor uses a half gallon of gasoline per hour, and cuts an acre every forty minutes. Old auto parts were used to build the mower. Its frame is welded.

Cutter at front of power mower is lifted by pedal controls to avoid rocks and obstacles in grass

# 

BEAM-POWER tubes now play an important part in the successful operation of modern high-gain amplifiers designed for use in homes, restaurants, hotels, schools and churches. With high-power sensitive tubes of this description, radio

engineers can now design neat and compact amplifiers that no longer need be concealed under the platform, behind drapes and similar inaccessible places, inviting careless regulation of reproduction.

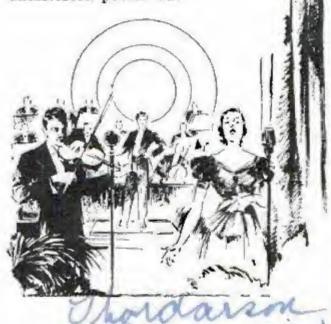

Although this portable amplifier is only 15 in. long, 8¼ in. deep and 10¾ in high, it has an undistorted power out-

put of 25 watts, and weighs only 28¾ lbs. All controls are illuminated and protected by a covered compartment. Dual tone controls for treble and bass may be mixed or operated independently. The input circuits provide two

high-impedance channels for crystal, dynamic, velocity or static microphones, and one phonograph pickup channel for a crystal or magnetic pickup. All three circuits may be "mixed" or blended as desired. This blending provides for adjusting the gain of each input so that musical backgrounds can be controlled properly.

This self-contained unit employs 3 type-6J7, 1, 6C5, 1, 5Z3 and 2 type-6L6-G beampower tubes in an inverse feedback circuit which is claimed to insure "distortionless" operation at full output and to reduce tube failures to a minimum because they are operated considerably below the maximum current and voltage ratings. The hum level is 74.5 db below maximum output.

257

## OW-COST Part I

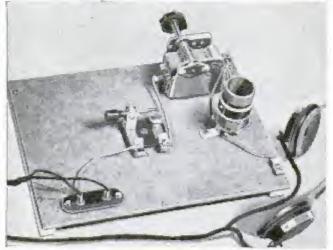

PHESE simple progressive receivers have been designed especially for the beginner. The first to be described is a crystal set that costs less than two dollars to build and can be assembled by any novice in an hour or so. Usually in progressing from one set to another there are quite a few parts wasted. This is

avoided by careful design so that the beginner can start with the crystal set, then, by adding a few parts build a 1-tube broadcast-band receiver; and finally, a very efficient short-wave set. Only one part is lost in the series, namely, the

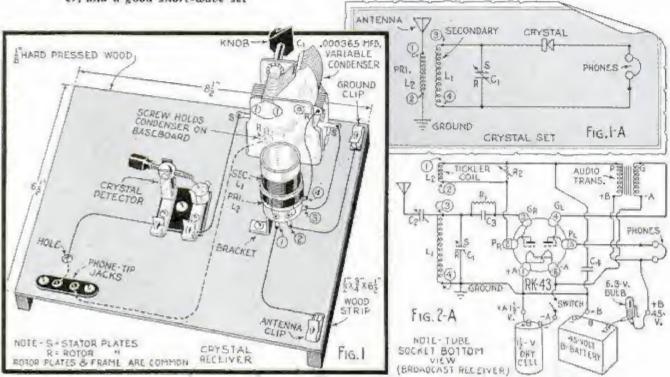

twelve-cent crystal detector.

Complete construction details for the crystal receiver are clearly shown in Figs. 1, 1-A and 1-B. The antenna coil is of the type used in midget a.c.-d.c. broadcast receivers and its primary (smallest) coil is variable by sliding it up and down over the secondary on the coil form. This permits adjustment for maximum selectivity

Above, photo of the completed crystal set which serves as a foundation unit for a 1-tube battery-operated broadcast receiver, and a good short-wave set

# RECEIVERS for Beginners

#### THREE-IN-ONE

Crystal, Broadcast and Short Wave

consistent with good signal strength. The wiring is done with No. 18 hookup wire with pushback insulation. Most of the wiring is above the baseboard except a short lead which connects the rotor (movable plates) of the variable condenser to the headphone jack terminal on the underside. The rotor plates of the condenser

are common with the metal frame, therefore this connection is made at the short machine screw that holds the condenser frame to the baseboard. The stator (stationary section) has an insulated terminal lug on each side of the condens-

## Copular MECHANICS

#### Sectional Cabinet Relay Racks for Amateurs

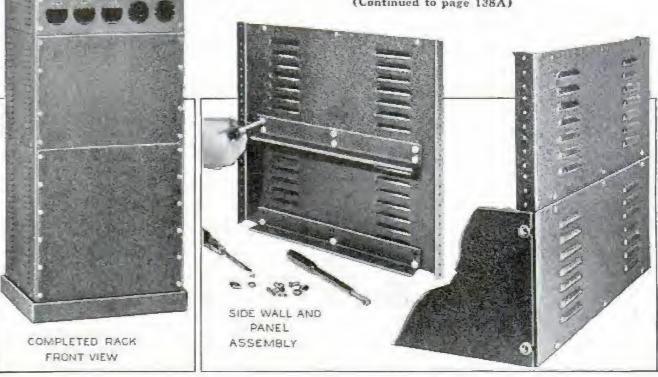

NOW you can build that new transmitter, amplifier or receiver in a neat black-crackle finished metal rack or cabinet of standard dimensions and obtain a compact commercial appearance heretofore only possible for those fortunate enough to have access to a well-equipped machine shop.

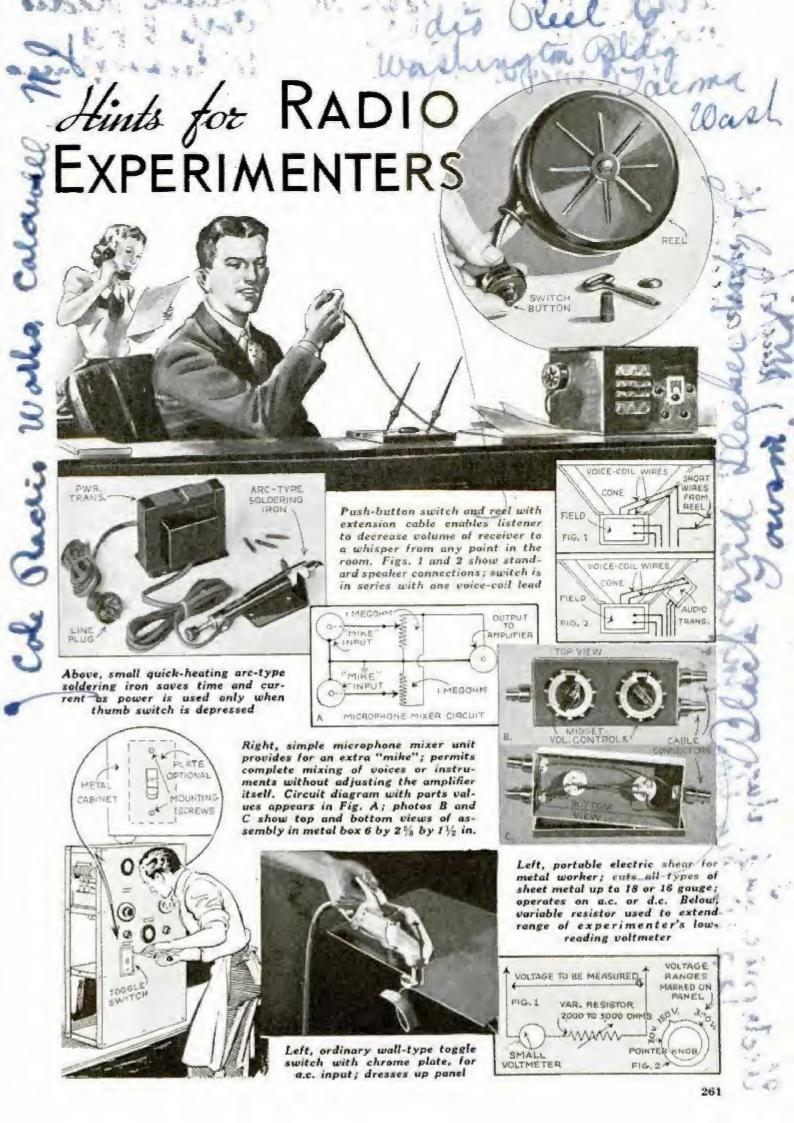

A screwdriver is the only tool necessary for assembling the sectional rack illustrated. The outstanding feature of a rack of this description is that the builder can assemble a complete rack starting from 3½ in, high and progressing in height in multiples of 134 in. until the desired height is attained. Additional sections are available for adding at any time.

The foundation unit consists of a strongly built base 201/4 by 153/4 by 21/2 in. on which the side sections are mounted, and a formed top cover 191/4 by 147/16 by 1/2 in. The side-wall sections are 14½ in. deep

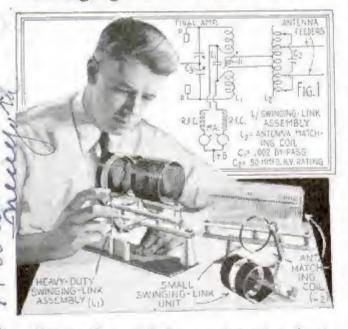

with front and back flanges, drilled and tapped for 10-32 screws to fit both W.E. and amateur-type notched rack panels. All side sections are louvered for ventilation and are available in various heights to fit standard rack panels. Back dust covers inclose the cabinet and are made of perforated sheet steel with re-enforced edges, for additional ventilation. The Bud-type method of side-wall and panel assembly is clearly shown in the lower photos. Angle-iron brackets hold the sections rigidly and are drilled with screw holes placed to match those in the side walls.

(Continued to page 138A)

#### Swinging Link Inductor Coils

Designed to aid the amateur to obtain accurate control of loading and excitation in the final stages of a transmitter, these swinging-link coils provide an independent link and base assembly which permits front-of-panel control of coupling. This unit makes it unnecessary to resort to makeshift means of control as is necessary with ordinary link-coupled systems. Fig. 1 shows a circuit using the swinging-link assembly and a B and W type antennamatching coil, to obtain maximum transfer of energy to the antenna.

#### Converter Changes D.C. to A.C.

This polarity changer converts a given voltage of direct current to the same voltage alternating current. For example,

if your house-lighting supply is 110 volts d.c., you can plug in this unit and obtain 110 volts a.c. for the operation of standard a.c. receivers and other electrical appliances designed for operation on alternating current. They are available in three 350-watt models suitable for different

home and industrial applications. Adjustable frequency control provides for the operation of electric clock motors and timing equipment, in d.c. districts.

#### Push-Button Radio-Phonograph

Now you can play your favorite phonograph records through a high-quality amplifier and have the kind of music you desire at any time, or, with this versatile instrument you also have a 2-band 6-tube superheterodyne radio receiver with pushbutton tuning. The receiver covers the range from 16 to 54 meters for important short-wave stations, and 175 to 550 meters for standard broadcast programs. This combination unit operates on 110-volt 60-cycle supply line.

[Blueprints covering radio construction articles in past issues are available for 25 cents each; original material lists and additional information can be obtained from our Radio Department without charge upon receipt of postage.

NEXT MONTH—How to Build an Inexpensive Battery-Operated Electric Fence Controller. This unit operates up to 5 miles of single-wire fence and is easily assembled from ordinary radio parts. Also Part II of the article, Low-Cost Receivers for Beginners. Completing construction of three progressive sets

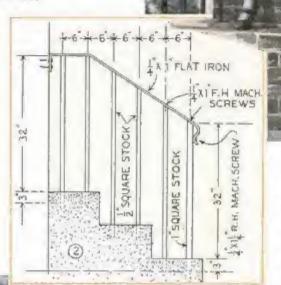

ORNAMENTAL IRON RAILINGS

made without welding • • •

#### By GEORGE B. HARRAN

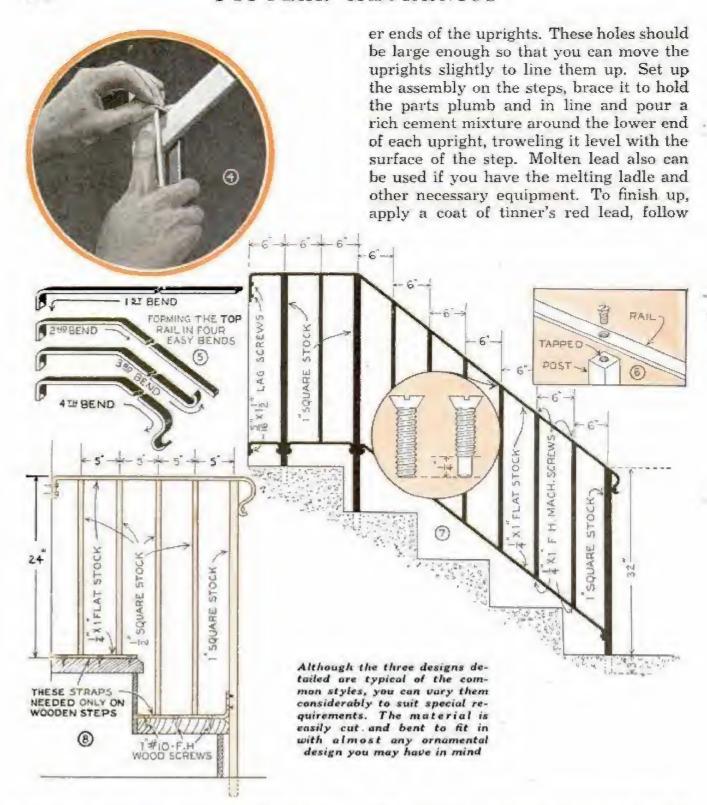

HERE'S a way to make decorative iron railings right in your home shop without the use of a welding torch. The railings can be made any practical shape or length with very little time and work. Fig. 1 shows an example of what you can do. Fig. 2 gives the essential details, the dimensions being only approximate, of course. You won't have any trouble getting the materials for they are standard sizes of ornamental-iron stock.

The first thing to do is make a full-size layout of the profile of the steps and the design of the railing as in Fig. 3. Then you measure and cut all the upright members with both ends square. Allow 2½ to 3 in. on each upright for setting in the concrete as in Fig. 2. Drill a hole for a ¼-in. No. 20 thread in one end of each up-

right to a depth of 1¼ in. After tapping, determine the angle of the inclined top rail and cut the tapped end of each upright to fit. Make a wooden angle gauge from your full-size layout and use it as in Fig. 4.

Now you bend the top rail to shape, proceeding with the bends as in Fig. 5. Again you have to resort to the full-size layout to get the spacing for the holes to be drilled for screws joining the rail to the uprights, Fig. 6. Notice that holes for the screws through the inclined section of the rail

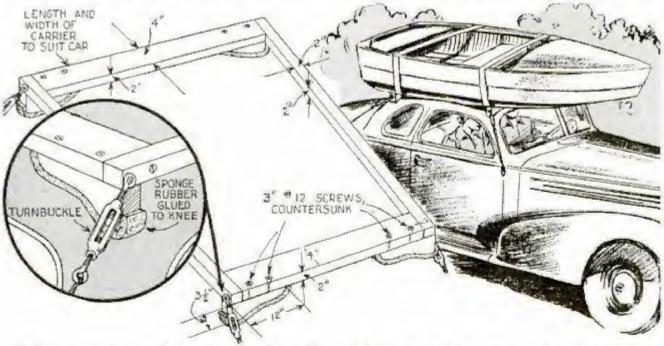

must be drilled and countersunk at an angle. File off any burrs or other irregularities that might interfere with a close fit of the parts. Grind the threads off the end of each screw as in Fig. 7 so that it will start easily in those holes which are tapped at an angle. Mix a small quantity of iron cement and apply it to the joint between the upright and the rail. Then drive the screws home.

With all this done you next chip holes in the brick or concrete steps to take the lowwith a coat of aluminum paint and finally with a coat of black or colored enamel. This finishes a railing of the type shown in Figs. 1 and 2. In Fig. 7 the construction is the same except that you use both a top and bottom rail. Fig. 8 details a simplified type of railing designed for wooden steps.

¶Keep a garden notebook and jot down variety of seeds planted, date of planting and first appearance of flowers; this information serves as a guide to future planting.

#### Carrier Transports Boat Safely on Top of Car

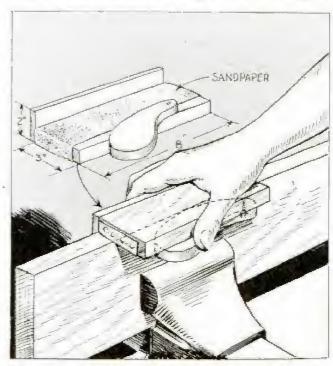

Taking your boat along is no trick at all if you spend a few minutes time to make this carrier, which fits on the top of your car. As you see, it's a very simple affair joined together with heavy screws for maximum strength, and is capable of carrying boats, kayaks and canoes up to 300 lbs. in weight. The carrier is supported at the corners by curved feet, which are cut to the contour of the car top and padded

with strips of sponge rubber to prevent marring the finish. Cradles cut to the contour of the boat bottom can be attached directly to the carrier frame with bolts. The cradles should be padded and fitted with adjustable straps of heavy webbing to hold the boat in position. Rods and turnbuckles are used to hold the carrier in place, these being cut to lengths to suit the car.—William D. Jackson, Knox, Ind.

#### This Self-Adjusting Sanding Block Assures Square Edges

To sand the edges of boards squarely and rapidly, one craftsman uses this unusual block. It consists of a 3 by 8-in. piece of wood to which is nailed a 2-in. strip of wood at right angles to one side. At the opposite side another piece of stock, cut to the shape shown, is pivoted to swing freely. The block is placed on the edge of the board to be sanded and the pivoted piece is pressed in against the side where it is held with the thumb as the hand grips the block in the manner indicated. The pivot block presents little friction to the work and keeps the sander from tipping so that the edge will be smoothed square.

(You will find that two thin coats of shellac give a hardwood floor a much better finish than one thick coat; the first one must be dried thoroughly before the second is applied.

This sanding block automatically adjusts itself so the abrasive surface rides square with the work

#### Soap Shaver from Bottle Caps Attaches to Wash Boiler

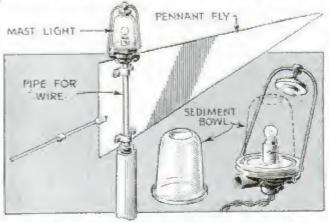

Pulling a bar of laundry soap over the edges of the bottle caps shaves off small pieces

This simple soap shaver can be made from wood blocks of the approximate size indicated and three or four bottle caps. The blocks are nailed together with a spacer between them providing legs to slip over the side of a wash boiler. When a bar of laundry soap is drawn over the edges of the caps, shavings fall into the water.

#### Combination Pennant and Light for a Sailboat

This combination pennant fly and mast light for sailboats consists of a number of easily obtained units. The light is merely a gasoline sediment bowl from an old car. The excess connections are removed with a hack saw, and a miniature bayonet or

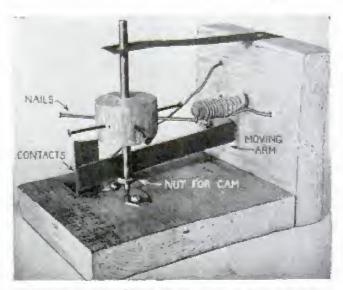

Boat light assembled easily from the gasoline sediment bowl of an old car

screw socket of the type used on some cars and many radios is attached. As the bulb is easily accessible and as it is waterproof, this light may be adapted to many other uses. The fly is made of any light metal and is attached to the mast as an assembly by using the hinge fastening taken from a lavatory cover.

-M. L. Harmon, South Bend, Ind.

#### Simple Electric Motor Is Built from Scrap Parts

Just to show your friends how simple it is to build a small electric motor that runs, in less than an hour, try this one. Nail together two pieces of wood to serve as a frame. The rotating part, or armature, consists of a nail serving as a vertical shaft, its pointed lower end resting in a punch mark in a small plate which is screwed to the base. Its upper end, from which the nail head is removed, passes through a hole drilled in a supporting strip. On the shaft is fitted a hardwood disk, such as a section of broom handle, drilled in the exact center to fit on the shaft snugly. Six

Changing the position of the nut on the armature varies the speed or reverses the motor

nails are driven into the disk to exactly the same depth and so that their heads will be equidistant. On the lower end of the shaft a hexagon nut is soldered, and a strip of tin, the moving arm, is carefully adjusted so that it contacts a smaller stationary piece only when one of the corners of the nut pushes it. The moving arm must spring free from the stationary piece when the corner of the nut recedes, but it must

not contact the flat faces of the nut. By experimenting with the position of the nut relative to the position of the nails on the armature, the speed can be varied and the direction of rotation changed. The nails on the armature rotate past a small magnet made by winding about a 10-ft. length of No. 22 insulated magnet wire on a nail driven into the side member as shown. One end of the wire is connected to the moving arm and the other to the source of current, which may be a transformer or two dry cells. The other side of the current supply goes to the stationary contact. In use, the current through the magnet attracts the nearest nail on the armature. When this nail comes opposite the magnet, the current is off, and momentum forces the nail on past the magnet. Then the nut on the shaft causes the moving arm to contact the stationary piece, allowing current to flow again, which attracts the next nail toward the magnet, and so on. Variations of the design, using as many nails as the nut has faces, may be made. A really fast motor consists of two square nuts with eight armature nails, or two hexagon nuts with twelve armature nails.

—C. E. Packer, Chicago.

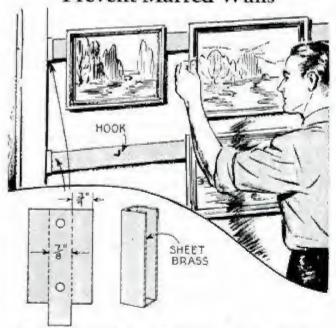

#### Saw Converted into Disk Sander

A circular saw can be converted into an efficient sander by substituting a sanding disk for the blade. When turned on a lathe and faced with sandpaper, ¼-in. plywood provides a good disk. It is best mounted so that the abrasive is on the side away from the bearings, a dado saw insert being used in the table to allow clearance for the disk.—H. R. Heydorf, Missoula, Mont.

A plywood sanding disk substituted for the blade on your circular saw converts it into a sander

#### Picture Racks in Exhibition Hall Prevent Marred Walls

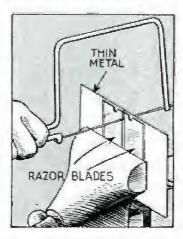

Removable wood strips between door and window casings support paintings on exhibition

Asked not to mar the newly decorated walls of a room used as a temporary exhibition hall for paintings, a group of artists employed the following method of hanging the pictures. Spaces between window and door casings were measured and lengths of ¾ by 3-in. finished pine were cut to fit between them. Then brackets of the type shown were fashioned from stiff brass and fastened to the edge of the door and window trim to support the racks.

-L. B. Robbins, Harwich, Mass.

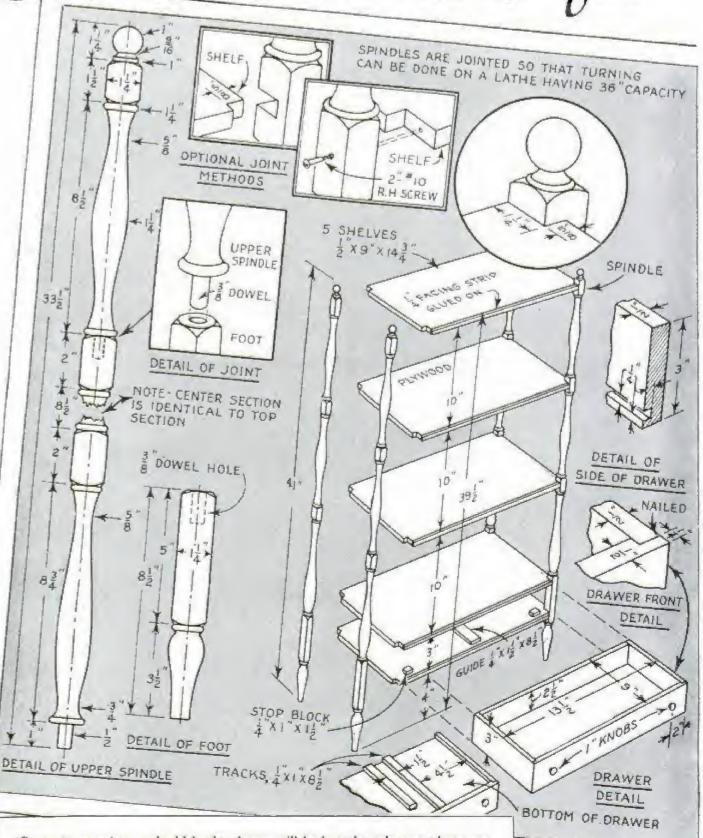

#### Thin Sheet Metal Cut Easily with Aid of Razor Blades

If you have occasion to make an accurate cut along a straight line in thin metal, an easy way to do it is to employ a jeweler's saw and two single-edge razor blades to serve as guides for the fine saw blade. Clamp one blade with its

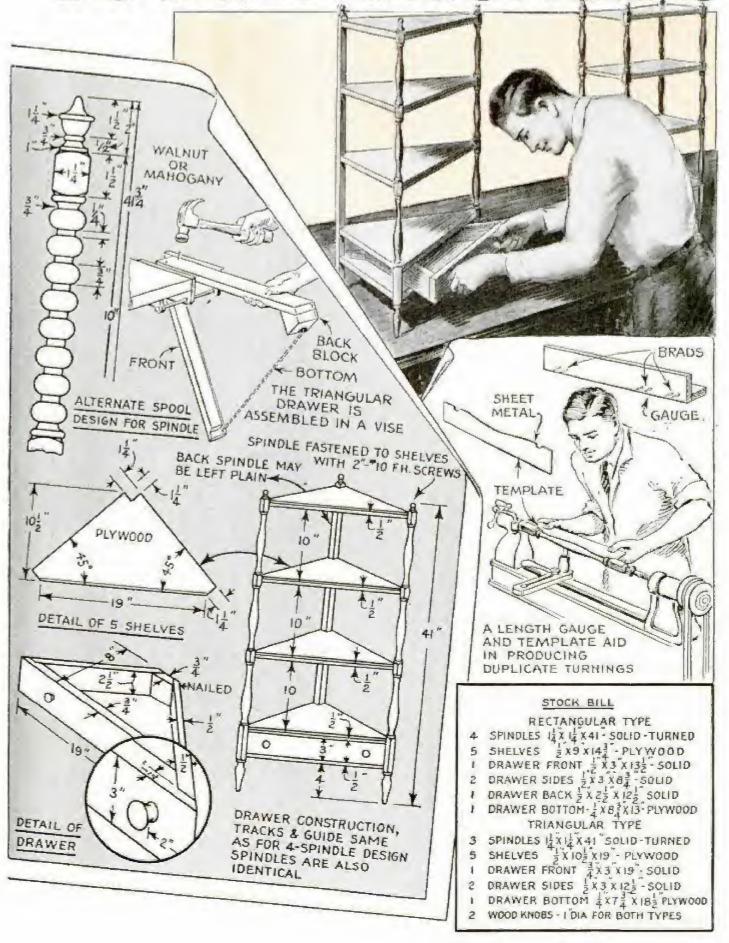

unsharpened edge along the line to be cut. Lay the saw blade temporarily along the edge as a spacer, and bring the second blade up to it, and clamp.

# SPINDLE RACKS for

Current magazines and odd books always will be in order when you have one or both of these neat little stands handy. A wood lathe is the only machine tool you will need to build either one. Simple joinery of the cases reduces construction problems to the minimum. Although walnut and mahogany are the woods specified, you also can use maple finished "bland" or stained a honey color to match other colonial furniture which you already may have

# BOOKS and BRIC-A-BRAC

#### Rubber Wheels for Model Plane from Ink Erasers

When the size of a model plane permits, use of ink crasers for wheels saves work

In some cases, round ink erasers provide good landing wheels for model planes. Simply remove the brush from the top of the eraser handle and attach the handle to the undercarriage of the plane with a small machine screw.

—E. P. Barnhart, Whittier, Calif.

#### Fish Cleaned with Car Valve

To quickly remove the entrails from a fish after cutting it open, one sportsman has found that an old valve from a car

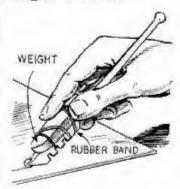

An old car valve carefully cleaned will remove the entrails from a fish in a jiffy

motor is just the thing. When used as indicated, it does the work efficiently without cutting or tearing the flesh. Of course, the valve should be cleaned and polished carefully before using it.

#### Solder-Weight on Glass Cutter Relieves Finger Strain

Finger strain of operating a glass cutter for any length of time may be relieved considerably by attaching a weight to the cutter. A piece of bar solder attached to the flat side of the tool

by means of stout rubber bands or small bolts will make a satisfactory weight.

#### Golf Tee Cleans Camera Lenses

Some types of camera lenses, especially those on box cameras, are rather inacces-

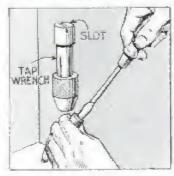

sible and difficult to clean. An easy method of doing the job is to take a small wooden golf tee and cover the concave top with a bit of cotton or cleaning tissue. Holding

the tee against the lens and twirling it between the fingers will clean the lens.

#### Tap Wrench in Tight Place Turned by Screwdriver

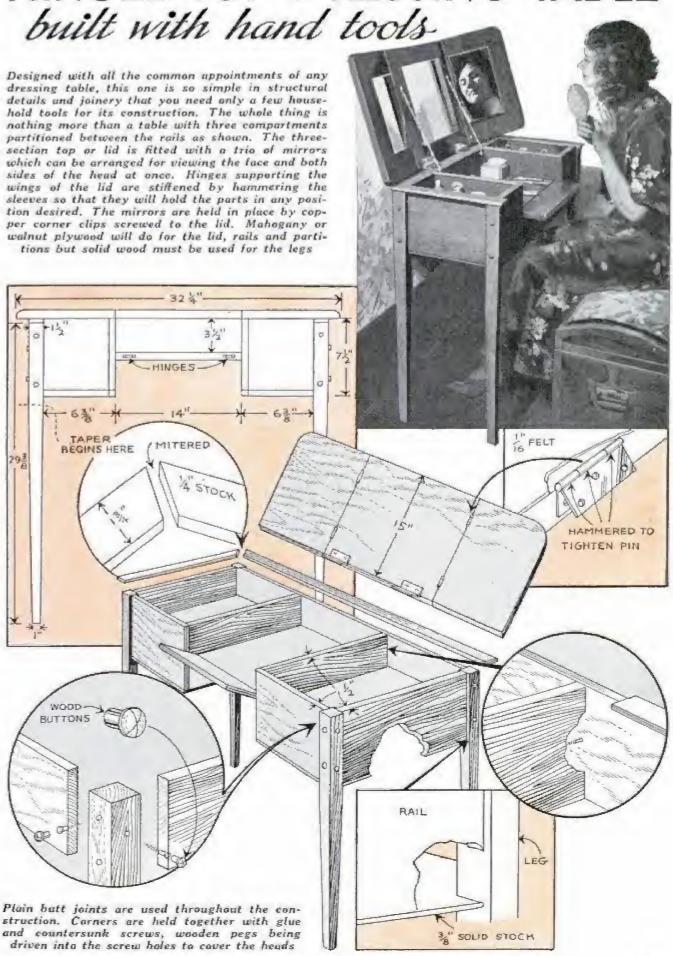

I have found this modified tap wrench handy when tapping small holes in corners or close to the side wall of a machine. I removed the cross handle and sawed a slot

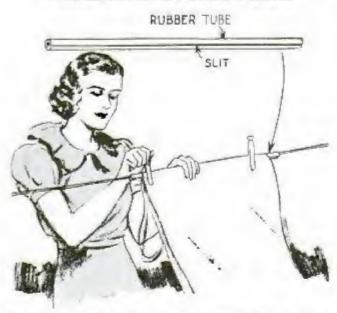

across the end of the wrench to take the screwdriver blade.

-Philip A. Eyrick, Arlington, Mass.

# HINGED-TOP DRESSING TABLE

#### Piece of Rubber Hose Protects Garment from Line Stains

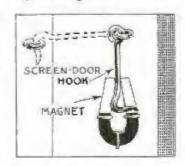

Small rubber tube slipped over clothesline protects clothes against soiling

When a delicate garment is hung on a clothesline, it may become line marked or stained where it is attached with the clothespins. To avoid this, slit a length of discarded bath hose and slip over the line.

#### Swinging of Screen-Door Hook Avoided by Magnet

To prevent the hook on a screen door from swinging between the frame and door when the latter closes, you can employ a small permanent magnet

as indicated. Wire staples hold the magnet under the hook in the position shown.

#### Shellac Brush Is Wrapped to Prevent Drying

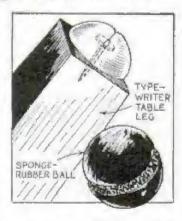

When you use a shellac brush several times a day, the muss and delay of washing it out with alcohol each time can be eliminated by wrapping the bris-

tles and part of the ferrule with a doubled sheet of wax paper. This should be twisted tightly about the handle to exclude air. Brushes protected in this way will remain soft overnight, despite the tendency of shellac to dry in a few minutes.

#### Silencing Typewriter Tables

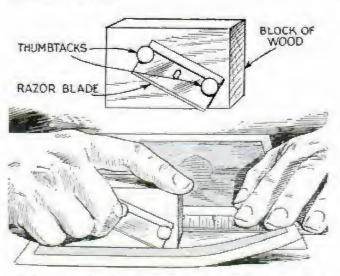

You can silence a makeshift type-writer table by cutting sponge-rubber balls in half and attaching them to the bottom of each leg. In cutting the balls (the penny variety will do nicely), a fine-tooth saw will

work better than a knife. The rubber can be attached with roofing nails, sinking the heads well into the rubber so that the latter folds over them as indicated.

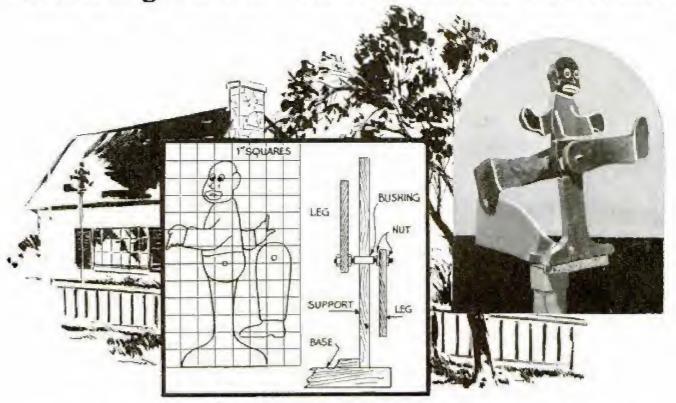

#### Paper Cutter from Razor Blade

A handy paper cutter is made quickly from a razor blade, a small block of wood and two thumbtacks. The blade is tacked to the block at an angle so that one corner projects slightly below the block. In use, the block is rested against a ruler and the blade itself follows the straightedge to make a clean, precise cut. The blade can be adjusted so that it cuts just through the stock but does not make a deep cut in the surface below.

Cutter is adjusted to various depths by loosening lower tack and moving blade up or down

#### "Running Rastus" Never Tires in the Wind

With his legs moving rapidly, "Running Rastus" is an amusing weather vane. Both the body and legs are scroll-sawed from \(^4\)-in. wood, after which the trailing edges of the legs are beveled like the blades of a

toy windmill, which they simulate. In assembling, the legs are locked on the threaded ends of a tiny shaft with nuts, a piece of tubing being inserted through a hole in the body to serve as a bearing.

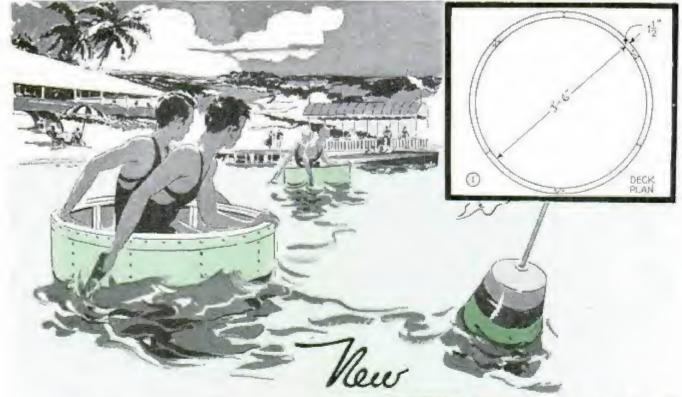

#### Bending Sheets Help to Form Sheet Metal in Home Shop

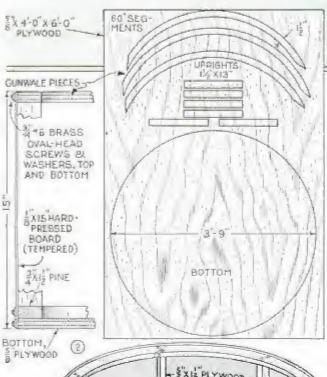

The handy man who has an occasional job of bending sheet metal can do it with fair accuracy by using a combination of bending sheets of various thicknesses. These make it unnecessary to have an individual forming block for bends of different radii. After determining the bend to be made in the work, sheets of the correct thicknesses to give the desired radius are placed on the forming block, and the assembly is clamped in a vise as indicated. The work is then bent over the assembly by tapping it lightly with a mallet. In the example given, a bend having a 1/2-in. radius was made by using two bending sheets 5/2 and 1/16 in, in thickness.

-Peter F. Rossman, Kenmore, N. Y.

¶If you have over-blued your clothing and cannot remove excess color by ordinary washing with soap and hot water, soak it in a mixture of hot water, 3 qts., and vinegar, 3 tablespoonfuls.

# BOTTOM, S PLYWOOD IS X 6 X 10 PLYWOOD BRADS BENT OVER CANCELLAND IN WICKING LAID IN PLANDER BRADS BENT OVER CANCELNA CANCELNA CANCELNA CANCELNA BRADS BENT OVER CANCELNA CANC

# WATER

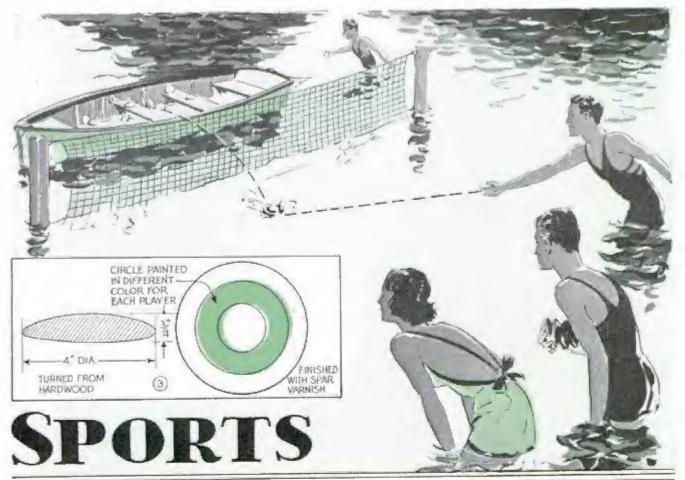

NO ONE in your beach party will be bored for want of something to do if you have several of these fun-making gadgets at hand. For example, there's, racing with the circular craft shown above, called a "Coracle" after ancient European fishing boats. This tricky craft will provide no end of sport because of the difficulty in making it follow a straight course.

Just follow the details shown in Figs. 1 and 2. You'll want to duplicate the parts, of course, so that you will have two or more completed craft. The paddle is simply a piece of ¼-in. plywood with rubber

loops for the fingers.

Then, there's "Skipperoo," strictly a water game and one that will revive memories of the fun you had as a youngster skipping flat stones across a pond. To play the game you need quiet water, a number of wooden disks, an old tennis net and a goal. The disks are turned from hardwood, making the bottom somewhat flatter than the top. Different colored disks are allotted to different players. Smooth the disk and give it a spar varnish or wax finish. The object is to skip the disk over the net into the boat

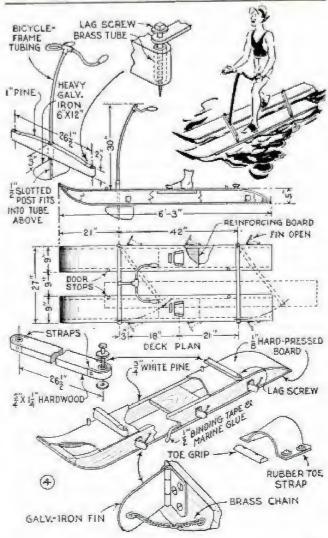

If you like a little more adventure you

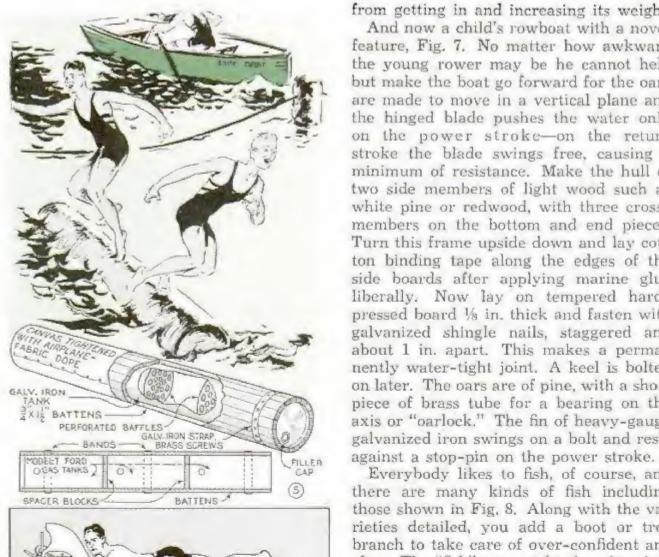

might try the "Sea Skis" detailed in Fig. 4. Two pontoons, linked in such a way that they are always parallel, enable one to "walk" about on smooth water.

Should you go in for log rolling, Fig. 5, you had best be prepared to swim a good share of the time. If you're an amateur at it, either you or someone else will have a lot of fun while you are learning. An artificial log can be made of a round galvanized tank covered with a wooden shell of battens bound with iron straps, as shown. Put the filler cap in the end so that buoyancy can be regulated by filling the tank with water. The log should float about three-quarters submerged. The tank must have three or more baffles inside to prevent the water ballast shifting too quickly. A satisfactory log also can be made by covering three or four Ford model-T gas tanks with battens and canvas. In this arrangement the water will need to be put in first and the tanks permanently sealed.

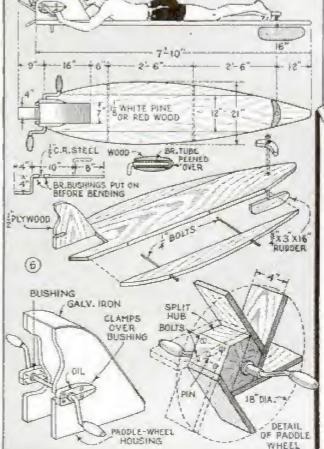

Another novelty is the "Tampa Tractor" detailed in Fig. 6, simply a light surfboard with a paddle wheel in front and a rudder which you control with your feet. When finished, the entire job should be painted or varnished carefully to prevent moisture

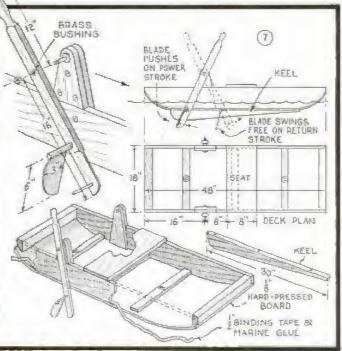

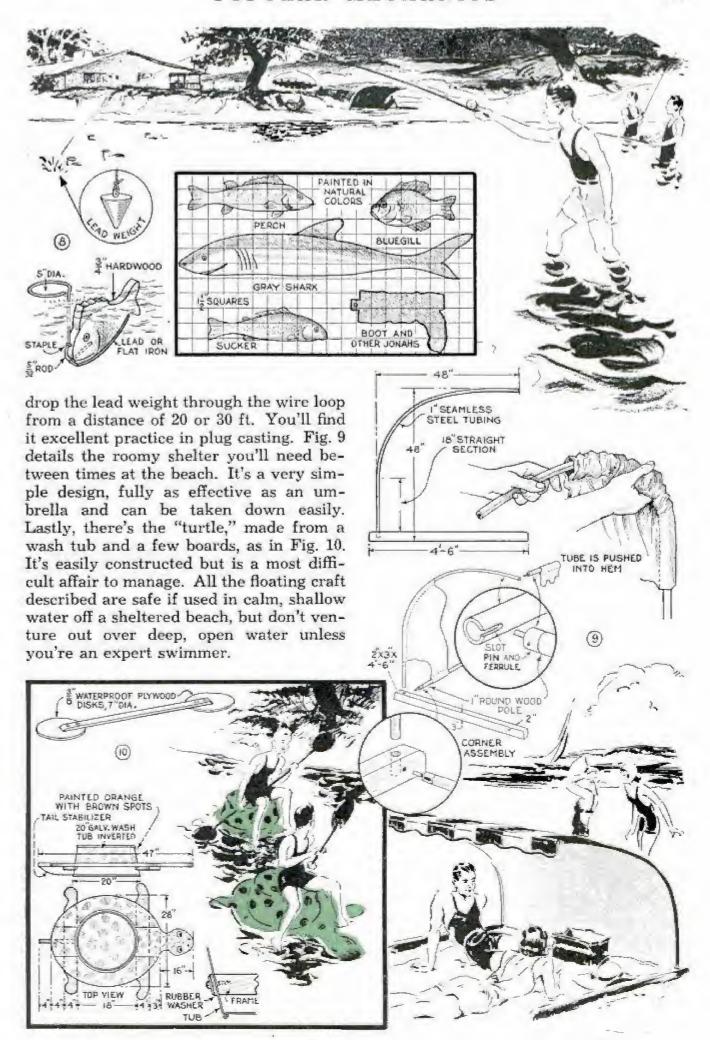

from getting in and increasing its weight. And now a child's rowboat with a novel feature, Fig. 7. No matter how awkward the young rower may be he cannot help but make the boat go forward for the oars are made to move in a vertical plane and the hinged blade pushes the water only on the power stroke-on the return stroke the blade swings free, causing a minimum of resistance. Make the hull of two side members of light wood such as white pine or redwood, with three crossmembers on the bottom and end pieces. Turn this frame upside down and lay cotton binding tape along the edges of the side boards after applying marine glue liberally. Now lay on tempered hardpressed board 1/8 in. thick and fasten with galvanized shingle nails, staggered and about 1 in. apart. This makes a permanently water-tight joint. A keel is bolted on later. The oars are of pine, with a short piece of brass tube for a bearing on the axis or "oarlock." The fin of heavy-gauge galvanized iron swings on a bolt and rests

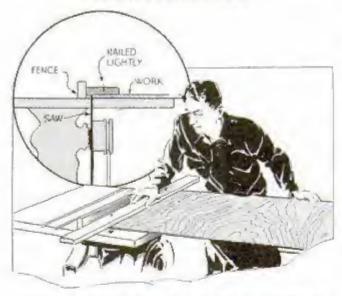

Everybody likes to fish, of course, and there are many kinds of fish including those shown in Fig. 8. Along with the varieties detailed, you add a boot or tree branch to take care of over-confident anglers. The "fish" are weighted so that they submerge with only a wire loop floating above the surface. Fishermen use the regular tackle and a small lead weight for "bait." The trick, and it's not so easy, is to

#### Squaring Ends of Wide Work on Circular Saw

Guide nailed to edge of large work to bear against rip fence to square it on a circular saw

It's easy to square the edge of a large piece of work that cannot be held against the miter gauge of a small circular saw. Take a wood strip that is longer than the work and has one edge squared. The strip is nailed lightly to the work so that it is square with one edge, and the saw is raised to cut just through the large piece. The work is then run through the saw with the strip bearing against the ripping fence, as indicated, to serve as a guide.

-Brooks Hill, Neosho, Mo.

#### Metal Rods Pointed Accurately with Help of Hand Drill

You can do an accurate job of pointing metal rods on the side of a grinding wheel if the work is chucked in a hand or

Metal rod rotated against grinding wheel with hand drill to get a point that is quite uniform

breast drill. The drill enables you to hold the work steady against the wheel and rotate it rapidly to get a uniform point.

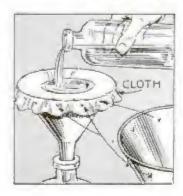

#### Suction Cup Aids in Opening Can of Fruit or Vegetables

When using a can opener of the type that revolves around the can as it cuts, the top, when completely cut off, drops into the contents and has to be fished out with a fork.

To avoid this, use a small rubber suction cup as a handle for the top. When the cutter has nearly completed the circuit of the top, grasp the cup with the left hand and hold it until the top has been severed.

#### Tabs under Rim of Tin Funnel Hold Strainer Cloth

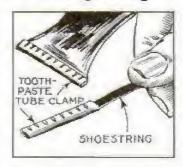

The problem of holding a cloth when liquids are to be strained throughitis solved as indicated. The cloth is placed over the funnel, the sides caught under the points, after which the

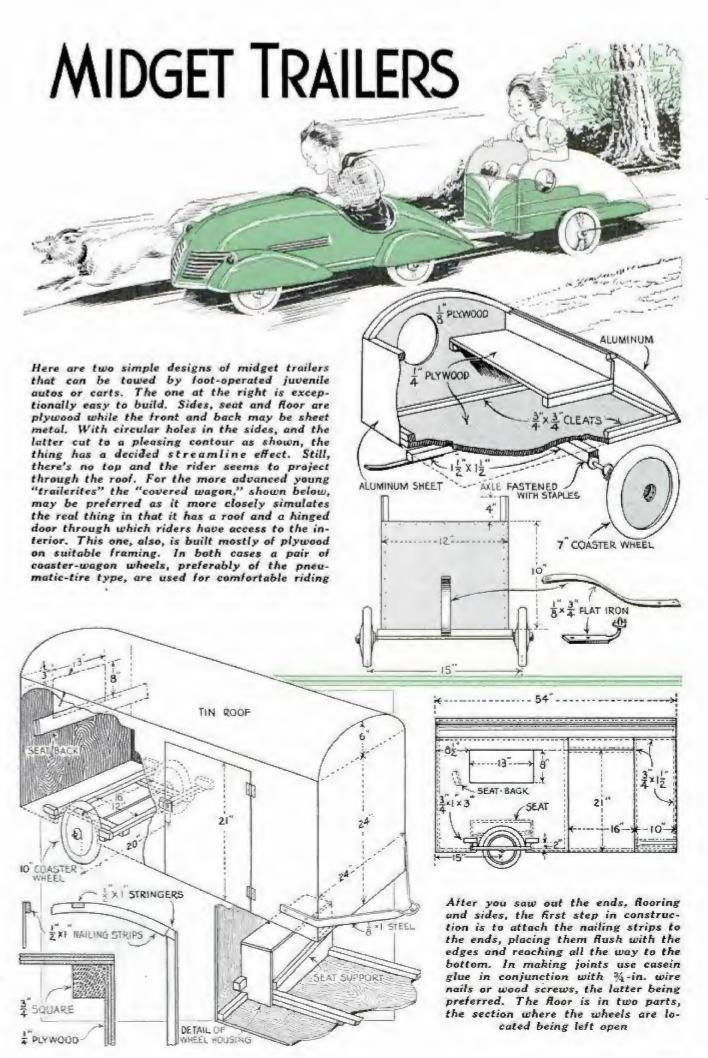

center of the cloth is pressed down with one hand, tightening the cloth under each point.—H. Paisley, Edmonton, Alta., Can.

#### **Emergency Shoestring Clasp**

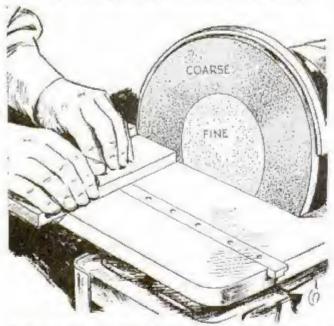

If you lose a clasp from the end of a shoestring, take the clamp from the bottom of an old toothpaste tube and clinch it around the string. A few light taps

with a hammer will point the end of the clamp so that it will pass through the shoe eyes easily.

#### Disk Sander Has Two Abrasives for Roughing and Finishing

Small articles are rough sanded on the outer part of the disk and finished on the inner part

Time can be saved in finishing small objects of plastic, wood or metal if the plate of a disk sander is fitted with two abrasive disks of different grits. On the average 12-in, plate, the inner abrasive disk would measure about 6½ in. in diameter. There is no waste in abrasive papers as the unused portions of the two disks can be fitted after the first set has worn out. Best results are obtained, however, if the finer abrasive is mounted in the center. The disks can be cut easily by scoring on the back side with a pair of sharp dividers.

#### Culvert Edges Plainly Marked

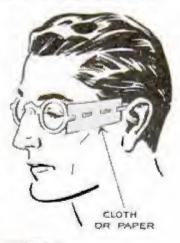

These simple guards for the end of a culvert have been found practical for a number of years. Slightly oxidized and whitish, they are quickly seen day or night. Each guard consists of about one-third of a small auto cas-

ing, the beads being removed back 2 or 3 in. from the ends so that the latter can be flattened and nailed to the culvert. Such guards are worth-while if for no other

reason than to prevent accidentally stepping or driving the car off the ends when turning into the drive from the highway. If black rubber is used the guards should be given a coat of white paint periodically.

#### Glare Shields for Sun Glasses

To prevent side glare when wearing colored glasses on excessively bright days, run the temples of the glasses through rectangular strips of dark paper or cloth as indicated. Make the strips about an inch wide,

#### Bottle Rack Leaves Hand Free

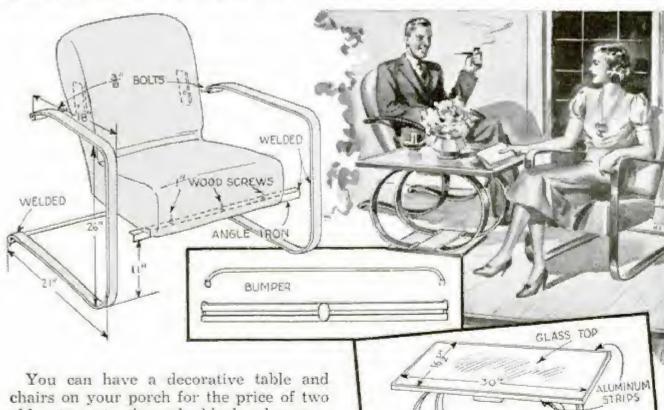

Bottles can't tumble off this rack because the caps are screwed firmly to the board. When it is necessary to pour out some of the contents of a bottle, it may be

Bottles can't fall off this rack because their caps are screwed to it

unscrewed and replaced with one hand. Two screws through each cap hold it firmly and prevent turning. If air must be excluded from the contents of the bottles, put thin, rubber washers under the screw heads and draw them up tightly.

#### Modern Porch Furniture from Old Car Parts

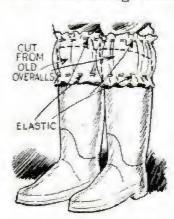

old auto seats, three double-bar bumpers of the type shown, and a few hours of your spare time. To assemble the table, take one bumper apart, cut the bars in two and then bend them to the shape indicated, using a heavy wood block nailed to a plank and faced with sheet metal as a former. Before bending the bars, they must be heated to a cherry red where the bends are to be made. They can be re-tempered by again heating to a cherry red, allowing them to cool until the red color disappears and then plunging them into a tub of cold water. The base and table top are wood panels with the bars screwed to them, the top being covered with plate glass, which is held in place with aluminum strips around the edge of the table. One bumper is required for the two legs of each chair, the bars being heated and bent to the shape and dimensions shown, and then retempered. The type of seat used will determine to some extent the method of fastening it between the legs. In the original, the front was screwed to a length of angle iron, which was then welded to the legs. The metal frame of the seat back was drilled and tapped for bolts, which were run through the eyes of the bumper bars. An iron rod is welded into the eyes at the floor ends of the legs to tie them together.

—Dallas Zollinger, Providence, Utah.

#### Leg Slip-Overs on Rubber Boots Keep Out Weed Seeds

TABLE LEGS

Campers and fishermen who wear rubber boots through brush and tall weeds are

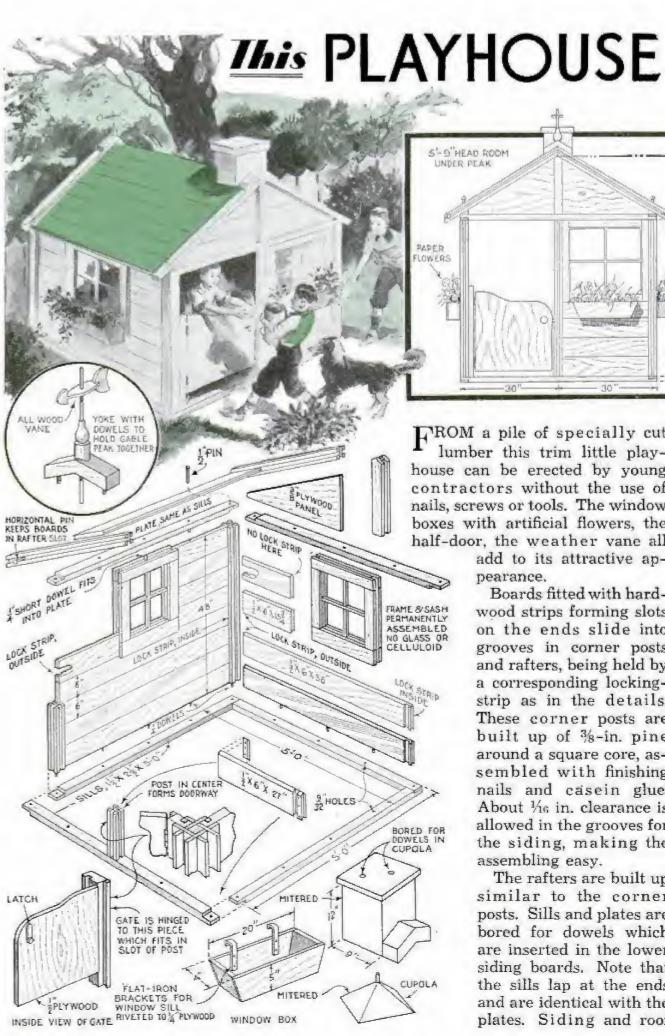

UNDER-SIDE OF TOP

often annoyed by having bits of broken twigs and weed seeds drop into the open boot tops. To avoid this, cut two sections from the legs of a pair of discarded duck trousers or overalls, hem the top and bottom and

THOLES IN

thread a stout elastic through them. Then slip these over the boots. They will repay you many times for the little time and trouble necessary for their construction.

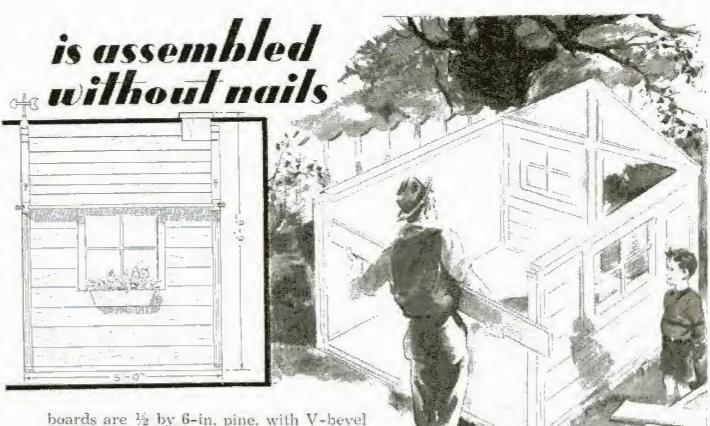

FROM a pile of specially cut lumber this trim little playhouse can be erected by young contractors without the use of nails, screws or tools. The window boxes with artificial flowers, the half-door, the weather vane all

add to its attractive ap-

pearance.

Boards fitted with hardwood strips forming slots on the ends slide into grooves in corner posts and rafters, being held by a corresponding lockingstrip as in the details. These corner posts are built up of 38-in. pine around a square core, assembled with finishing nails and casein glue. About 1/16 in. clearance is allowed in the grooves for the siding, making the assembling easy.

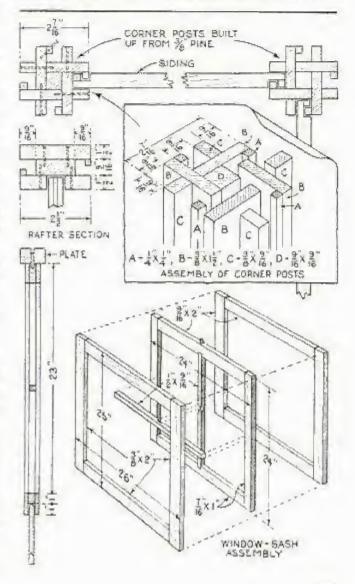

The rafters are built up similar to the corner posts. Sills and plates are bored for dowels which are inserted in the lower siding boards. Note that the sills lap at the ends and are identical with the plates. Siding and roof

boards are ½ by 6-in. pine, with V-bevel and groove as shown. These boards are in three lengths—for the full width of the structure, for half-widths as at the side of the door, and the short ones to go alongside the windows.

The peak of the gable is held together with a wooden yoke, which straddles the ends of the rafters. Two of these yokes are required. Window boxes made of ¼-in, plywood are supported by two flat-iron brackets as shown. The half-door or gate is hinged to a piece which slides down in the slot of the corner post and is hung to swing out. A wooden latch, as shown, fits into the slot of the other door post.

Window frames are grooved at the sides and across the bottom to fit over the siding, and at the top a short dowel is set into a hole bored in the plate. The central framework with the mullions is of %s-in. material while the outside framing is of %-in, stock. No glass or celluloid panes are used. Study of the details will show that the design can be changed easily. For example, you can make duplicate parts for two structures, join these end to end with a special beam under the central rafters and you have a schoolhouse. In the original design the parts were left unpainted, as the young builder usually likes to work with new boards. Of course, if the house is to be erected outdoors and exposed to wet weather, it should be varnished or painted.

#### Ends of Square Work Surfaced Quickly in Jig

Ends of small square work rapidly finished with this jig which is rotated in a lathe

On a job of making up a number of small square sticks that had to be surfaced on one end, the work was done rapidly in a lathe with the simple jig shown, which proved better than sanding. The jig consists of a short piece of iron rod with a shallow ½-in. hole drilled in one end. The bottom of the hole was prick-punched to make it rough, after which it was chucked in the lathe, rotated rapidly and the ends of the work pushed into it as indicated.

#### Tennis Net of Chicken Wire Lasts Indefinitely

The park department of a mid-western city has reduced costs on tennis courts by substituting regular chicken wirefor regulation nets. The wire is tightened occasionally. It does not shrink nor stretch with

changing weather and lasts indefinitely. The photo shows the type of pipe post with pulley and ratchet to support the wire, which is painted and then padded along the top edge with canvas.

#### Padded Feet on Small Boxes from Thumbtacks

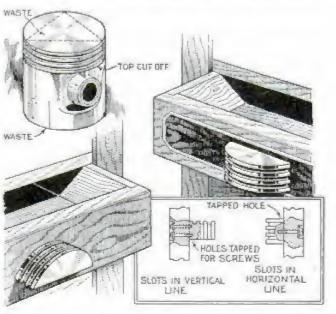

Padded feet on small fancy boxes and other wooden objects are made e a sily from thumbtacks whose heads are covered with two small rubber bands cut from thin rubber

tubing. Stretch the bands over the heads of the tacks, letting the points pierce the bands to hold them in place.

#### Modern-Furniture Drawer Pulls from Old Auto Pistons

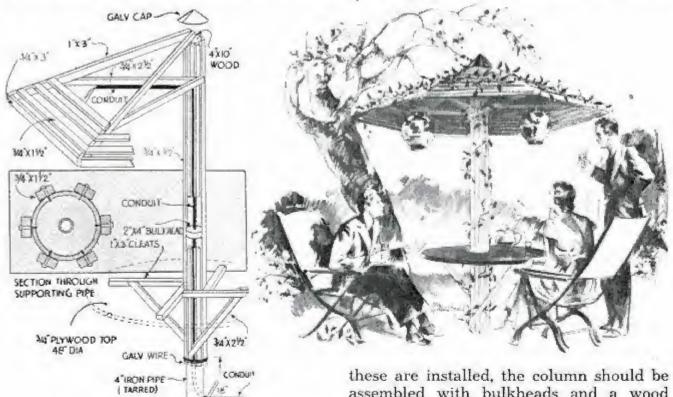

Drawer pulls that go well with modern furniture can be had by sawing off the tops of auto pistons. The top is cut into three parts as indicated in the upper left-hand detail. After this has been done the pieces

Ring groove portion of old auto piston provides madern drawer pulls when cut and given a high polish

are polished highly and drilled and tapped for attachment to the drawers with screws. The pulls can be mounted with the slots running either vertically or horizontally.

# Umbrella Garden Trellis Has Luncheon Table

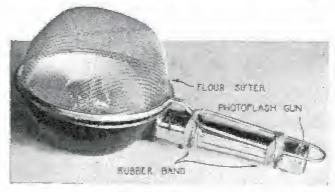

Built in the form of an umbrella, this novel garden trellis is provided with lights and a table top, and when covered with a vine, will make you feel more comfortable under it than a fabric umbrella would, because of air circulation. An iron pipe 4 in. in diameter forms the support and will last indefinitely when coated with tar paint. Crossarms of pipe underground prevent it from tilting, even in soft earth. Six evenly spaced holes drilled and tapped near the upper end, take screws, which hold upright battens that sheath the pipe. Before

I GALV, PIPE

assembled with bulkheads and a wood cylinder in the top. Cleats and diagonal braces keep the table top of water-resistant plywood rigid. Galyanized screws and casein glue are used in assembly, and when completed the table should be painted, special attention being given to the edges to further prevent moisture seepage. The conduit for light wires should be installed underground at the beginning of construction, and in the column as you go along. Build the awning as shown, spacing the slats their own width apart, and capping the peak with galvanized sheet iron for protection against rain. To assure shade the first season, morning-glories can be planted while slower-growing vines are becoming established.

# Shield on Photoflash Lamp Avoids Injury if Bulb Bursts

Should a photoflash bulb accidentally burst, this guard will prevent injury from flying glass

As a protection against possible bursting of a photoflash bulb, I often use a flour sifter over it as shown. Although bursting of a bulb does not happen often, I feel better when using this guard, especially when taking shots of children and babies at close range. By scattering the light rays, the screen also acts as a diffuser, resulting in a slight reduction of light intensity, which is compensated for by opening the camera lens one more stop.

-Arthur Trauffer, Davenport, Iowa.

#### Pipe Dropped into Deep Well Quickly "Fished" Out

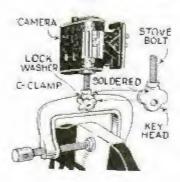

Long length of pipe dropped into deep well quickly removed with this "fishing" tool

Having the misfortune to drop a 100-ft. length of 2½-in. pipe into a deep, artesian well, it was removed in one hour with this tool. It consists of a length of heavy flat iron folded in the center to provide two legs riveted together with spacers between them, width of the spacing being determined by the inside diameter of the pipe. A pointed dog pivoted between the legs of the iron with the pointed end upward as indicated, bites into the inside surface of the pipe after the tool has been lowered into it and then pulled upward. The lower ends of the tool are pointed to simplify insertion into the pipe. Before trying to remove the pipe, it's a good idea to lower a small bucket filled with rocks to locate the top of the pipe to be removed so that you can tell at what level to work with the fishing tool.

-Walter U. Akerman, Dover, N. H.

#### Camera Is Supported on Chair by Altered C-Clamp

With this support, which consists of a C-clamp and two stove bolts, you can use a chair, table or other object as a substitute for a tripod to hold a small camera. Get a small bolt that will screw into the camera socket and solder the head of a key into the slot. Then drill the clamp so that the bolt can be pivoted to it with another one fitted with a key head to provide a thumb screw, using a nut to draw it up tightly.—Dr. C. W. Clifford, Salem, Ore.

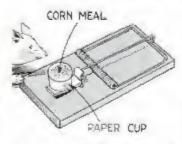

#### Rubber Tube over Pencil Clip Grips Pocket Tightly

If the clip of a fountain pen or automatic pencil becomes so weak that it does not hold, slip a small piece of rubber tubing over the clip as indicated in the photo. This

enlarges the gripping surface and provides friction so that the pen or pencil will not be dropped out of the pocket.

#### Corn Meal Is Good Rat Bait

Corn meal is an excellent rat bait for traps, and is most effectively used when put in a shallow paper cup that has been fastened to the

trigger of the trap. This makes it necessary for the rat to reach up and press down on the edge of the cup.

#### Small Corks Removed with Screw

Amateur photographers who find that ordinary corkscrews have too coarse a thread to remove small corks from small glass vials containing developer, can use a No. 7

wood screw about 1½ in. long. A knob or handle for turning the screw is made from a piece of ½-in. round wood which is drilled to take the screw tightly.

-Sidney Pott, Victoria, B. C., Can.

"WATER BUG"
a beach play boat RESEMBLING a kayak in both appearance and construction, this canvas-covered play boat can be built by anyone-even the beginner in boatbuilding. It handles easily and will not tip over. The

frames are cut from moistureresisting plywood, Fig. 1, and assembled with the keelson and sheer battens. Note that the battens are parallel as in Fig. 4, and that the deck and bottom curves are identical in each frame as well as the transom. The frames are spaced in their relative positions along the keelson with nails that can be drawn out later, after which the sheer battens are installed temporarily. When the frames are located and squared to your satisfaction, fasten the sheer battens and keelson with 11/4-in, No. 6 brass flat-head screws, well countersunk, Fig. 2. Apply casein waterproof glue to these and all

Now install deck and bottom battens with 1-in. No. 6 brass screws. Use eleven deck battens spaced uniformly. The bottom battens are butted together at the

48/6

ALL END DIMENSIONS,

24

19"

edges to form a solid surface as in Fig. 5. Batten ends are screwed to blocks, Fig. 3, so that they are flush with surfaces of stem and transom. This permits the canvas to be stretched smoothly. Before fitting the cockpit coaming, lay the bottom canvas (10-oz. duck), stretching it snugly all around and tacking along the top of the sheer battens and over the stem piece. It is also tacked over the edge of the transom. Apply marine glue along the edges of the wood, and stagger copper tacks about ½ in. apart. The tacks are covered with a brass strip or angle, which is screwed down.

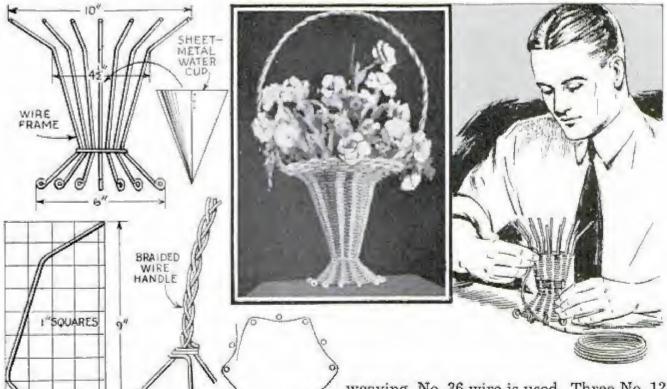

Trim away the canvas around the edge and put the deck canvas on. This laps over the sheer battens to which it is tacked after marine glue has been applied under it. Tack around the edges of the cockpit, using marine glue as before. Next, apply airplane fabric dope to deck and bottom canvas. When this is thoroughly dry the cockpit opening in the canvas can be cut out with a razor blade and the coaming fitted in place. The coaming, by the way, is a single strip of 1/8-in. hard-pressed board, which has been steamed and bent to a semicircle around a wood form. The back of the cockpit is fitted with mahogany. Molding around the top of the coaming stiffens and protects the edge, and gives a finished effect.

A false bottom can be made fixed, or removable. Around the sheer battens, over the tacks, screw a hardwood strip about 34 by 1/4 in., and to this secure a rope buffer all the way around, and through the groove in the brass nosepiece. If desired, weight of the boat can be reduced considerably by sawing out some of the central area of the plywood frames; even 1/4 inctead of %-in, battens are permissible. And to render the craft non-sinkable in case the canvas is punctured, an inflated inner tube can be put under fore and after decks. The doped canvas can be made smooth and slick by several alternate applications of paint and fine sandpaper, finishing with two coats of spar varnish.

#### Filling Cracks at Baseboards

If baseboards or wall molding have pulled away from a wall and cannot be renailed, fill the crack with paste wood filler mixed to the consistency of soft putty. Push it into the crack and then run the finger over the filler several times to make it smooth.

# Wire Flower Basket Will Last Indefinitely

Woven from wire, this basket is easy to make and has a sheet-metal container inside to hold either cut or artificial flowers. The skeleton or frame of the basket consists of twelve lengths of No. 12 wire bent to the shape indicated in the squared detail, and soldered to the inside surface of a 2-in, wire ring near the base. For the

METHOD OF WEAVING

weaving, No. 36 wire is used. Three No. 12 wires are braided to provide a handle, the ends of one wire being twisted around the assembly where the braiding starts and ends to give a decorative effect, after which the projecting ends of the three wires are spread and soldered to three of the frame wires on opposite sides to secure the handle to the basket. The seam of the funnel-shaped container is soldered to make it watertight. The finished basket can be enameled any color.

—Harold Jackson, Kankakee, Ill.

### Opening in Fence Admits People but Keeps Out Livestock

Installed in the fence around a country church, this opening allows people to walk through without bothering with a gate, but keeps out horses and cattle. Peeled cedar posts are set in two rows of three each, spacing the rows so that persons can walk between them freely.

#### Window Draperies Held Straight

Window draperies can be held straight by weighting them with small flat chains run through the lower hems, allowing one link to extend beyond each edge. These can be fastened over small hooks screwed into the baseboard and will prevent the draperies from blowing out the window.

#### Auxiliary Table on the Shaper Gives Extra Support

Board clamped to shaper fence flush with table top supports large work

Whenever additional table area is aesired to support large work adequately while shaping it, an efficient set-up can be improvised quickly as shown. A flat board is clamped to the lower edge of the fence so that it is flush with the top of the table.

#### Fixture Simplifies Wire Brazing

A fixture that holds the ends of small rods or wires in alinement while soldering or brazing them can be made from a metal plate and two radio binding posts. Remove the knurled screws from the posts, and enlarge the holes through the sides slightly, unless only small wires are to be

This fixture holds ends of rods or wires while soldering or brazing them together

held. Then notch one side of each post as shown in the photo, to insert or remove the work easily. The binding posts are fastened by means of their regular mounting screws to the metal plate, which is drilled to receive them. It is desirable to add a weight, such as the gear shown in the photograph, unless the plate is fastened to a bench or other support.

-Walter E. Burton, Akron, Ohio.

#### Blowtorch Burner Orifice Cleaned with Suction Cup

When the orifice of a blowtorch becomes clogged, a better method of removing the obstruction than poking it back with a wire or needle is to use a large suction cup. Empty the torch, leaving off the filler plug at the bottom. Then apply the cup to the bottom with edges slightly greased,

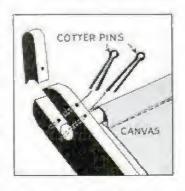

and make several strokes with the burner valve wide open. In most cases, this operation will draw the obstruction away from the orifice

and into the body of the torch where it can be flushed out. Removal of the packing nut and valve is unnecessary. This method also eliminates the possibility of enlarging the orifice.

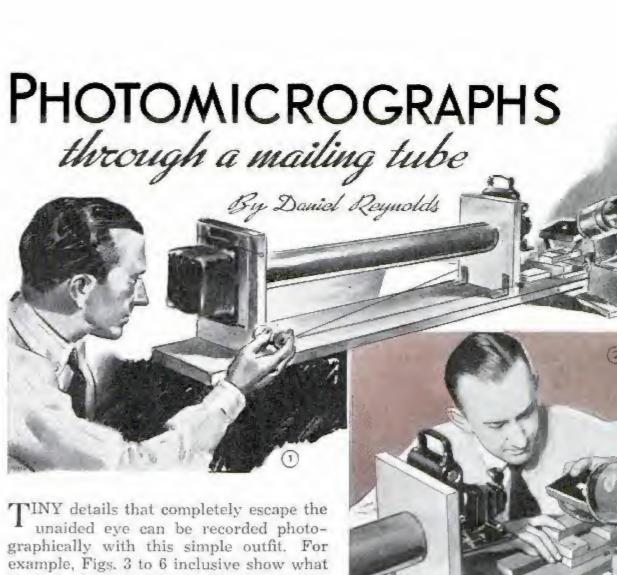

#### Canvas Seats on Porch Furniture Removable for Laundering

Canvas seats on porch furniture are removed easily for laundering if the ends of the frame in which the cross rods are

supported are slotted as indicated. The ends of the canvas strips are provided with open hems to receive the rods. When reassembled, the block which was removed from the

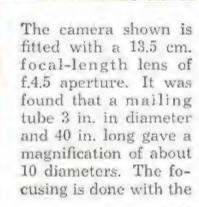

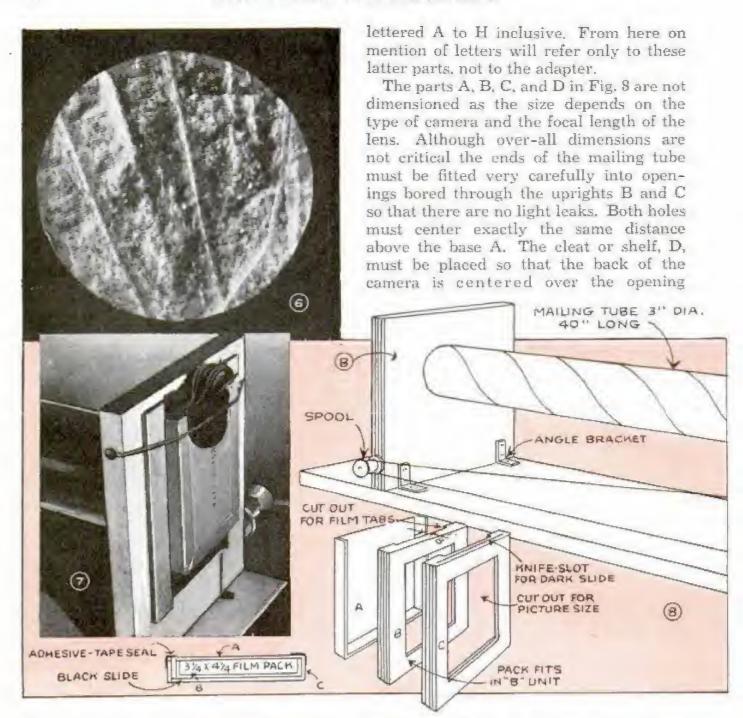

slot is replaced and a hole is drilled to receive a cotter pin. A second pin is inserted through the frame and cross rod.

TINY details that completely escape the unaided eye can be recorded photographically with this simple outfit. For example, Figs. 3 to 6 inclusive show what you can do in making photomicrographs. They are in order: the head of a grasshopper, the seed of the common dandelion, a section of silk hose and a portion of a butterfly's wing. Fig. 1 shows the complete outfit set up and Fig. 2 the position of the easel or stage and the lighting arrangement.

Any open-back folding camera can be used. Even a box camera will give good results with some adaptations. The amount of magnification or enlargement of the subject depends upon the focal length of the lens and its distance from the plate.

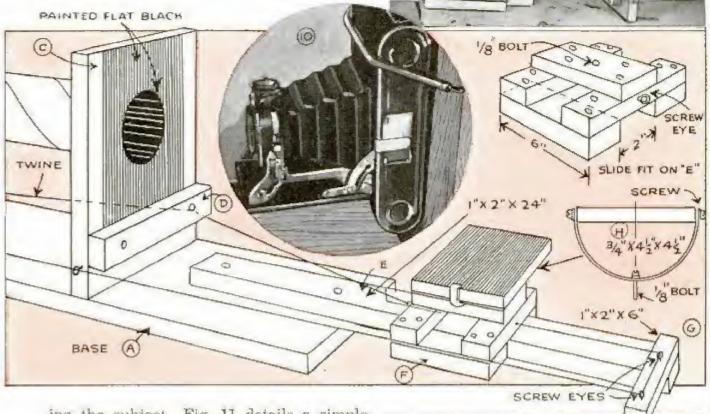

lens at its largest aperture, and once the subject is in sharp focus, the lens is stopped down to its smallest aperture, in this case f.32. To determine the time for average subjects, you multiply the normal exposure by ten. This exposure value has considerable variation, of course.

Now notice Fig. 7 and the parts A, B, and C in the two lower-left details, Fig. 8. The latter show how you can make up a film-pack adapter of odds and ends of sheet metal, plywood and tape. Fig. 7 shows the whole arrangement in place. Adapters for cut film or plates which you already may have, can be used, of course. Note also that the parts of the structure supporting the adapter, camera, and stage are

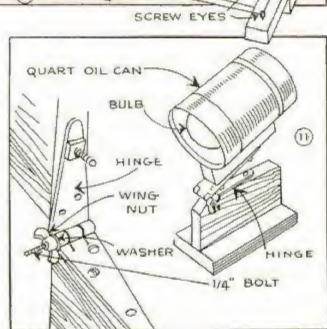

through the tube. A curtain spring holds the camera in position as in Fig. 10. The inside of the tube and the other surfaces of the uprights B and C should be painted flat black. The inside of the tube can be painted with a cloth swab dipped in the paint and drawn through with a string. Parts E, F, G, and H comprise slide and stage on which the subject to be photographed is mounted and brought into focus. The part E is simply a 2-in, strip screwed to the base. A 6-in. arm, G, is screwed at right angles to the outer end as shown and carries two screw eyes through which the control cord passes. The stage, H, is bolted to the slide F, and is provided with a universal adjustment so that it may

be tilted or pivoted to any angle desired, as in Fig. 9. The slide carrying the stage is moved nearer or farther from the camera lens as required by means of the cord, which is attached to the slide as shown and runs back to a spool screwed to the upright B. It is looped once around the spool and then the free end is carried back through a hole in parts C and D and tied to a screw eye in the slide as shown. The cord should be taut so that the stage can be moved without taking up any slack. You substitute a small ground glass for the pack adapter when focusing.

Finally, you must have a means of light-

ing the subject. Fig. 11 details a simple and effective lighting arrangement, Remove the pin from an ordinary iron-strap hinge and substitute a small bolt with wing nut as shown. This provides a means of tilting the reflector to any angle. Tightening the wing nut holds it. The subject to be photographed is mounted on the stage near the front edge and the table is tilted slightly toward the camera. Certain subjects have to be outlined with small squares of white paper and often the light should be diffused with a single thickness of tracing cloth. By doing a little experimenting with various screens and colored Cellophane in front of the lamp, many novel effects can be obtained,

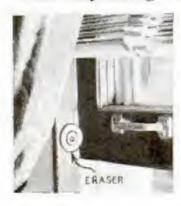

#### Lantern Type Sewing Basket Has Removable Cover

Lifting off the cover of this ornamental lantern exposes a convenient sewing basket

Resembling a Chinese lantern when the cover is in place, this novel sewing basket can be kept at hand on a table where it will serve as an ornament. When the cover is removed, thread, needles, thimble and scissors are all conveniently in place. The inside part is light sheet metal attached to a wood base and consists of two sides with two partitions set in some distance from the edges to provide a well in the center for scissors and similar articles. Pockets hold buttons and other small accessories while wood spindles or dowels set in the base at the sides provide a handy place for spools of thread. Two metal handles pivoted between the sides, pass through an opening in the top of the cover.

#### Self-Adjusting Window Silencer

Suitable for home or car, this window silencer may be made from a pair of round typewriter erastened to each side of the casing with round-head screws as indicat-

ed. By pressing the edge of the eraser snugly against the sash when marking for the screw holes, adequate tension is assured when the eraser is in place. The screw should be left just loose enough for the eraser to roll freely. When the window is raised or lowered no attention or adjustment will be necessary to control all looseness. When making this installation in an automobile, extra-length sheet-metal screws will be needed and the installation should be made only where the glass edges are vertical instead of rounded and where the glass has no forward and backward movement.

#### Cutting Small Work on Band Saw

When sawing very small pieces on a band saw, the slot in the table insert is too wide to give good support. To remedy this, a piece of thin scrap material is clamped on the

saw table as shown. This little trick also will help to avoid splitting the underside of the sawed edge.

#### Attractive Signs Made with Solder

With a smooth board of the desired size and a spool or two of wire solder, it is possible to make an interesting and effective sign almost as easily as one would write it with a pencil. The solder is bent according to a design previously written on a piece of paper, each word being a

Using wire solder to form lettering or writing is especially handy in photographic work

continuous piece. The pieces are held in place with short pins, placed in the folds of the letters where they are quite inconspicuous. A useful application of this type of lettering is in photographic work where it is necessary or desirable to include text on pictures and to make greeting cards or announcements photographically. The lettering can be photographed simultaneously sometimes with the subject, that is, as part of the original picture. Or, the negative of the lettering can be used in combination with the picture negative. Striking movie titles also can be made by the method described.

#### Top Putty Seals Camera Pinholes

Pinholes in the bellows of your camera can be sealed neatly by coating the worn spots with a thin film of black autotop putty. This dries overnight into a tough flexible film that will fold with the bellows.

#### Stop Masks from Rubber Bands for Painting Objects

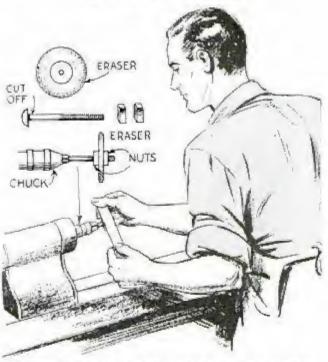

When you wish to paint round or square pieces of wood or metal, and the finish is to end at an even line around the work, ordinary rubber bands can be used as stop masks. Merely slip them in place, paint up to them, and when the finish is dry remove them with a pair of tweezers.

-Kenneth Murray, Sturgis, Mich.

When you want a paint finish to end evenly on round or square work, try rubber bands as masks

#### High-Speed Flexible Polishers from Ink Erasers

Typewriter eraser rotated at high speed in a lathe polishes light or delicate work

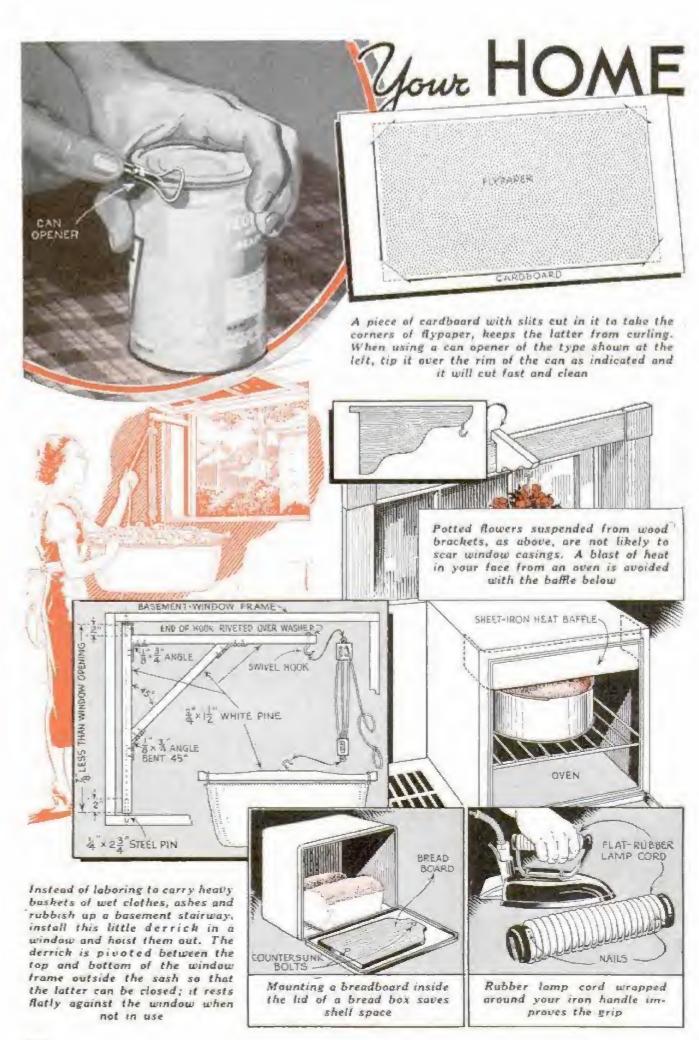

A high-speed polisher can be made from a typewriter eraser by removing the handle or brush portion and fitting it on a mandrel so that it can be chucked into a lathe or drill press. The mandrel consists of a short bolt small enough to pass through the center opening in the eraser. The head of the bolt is cut off and the eraser is clamped in position between two nuts. If a polisher of this type tends to vibrate because it is not perfectly round, true it up with a piece of sandpaper.

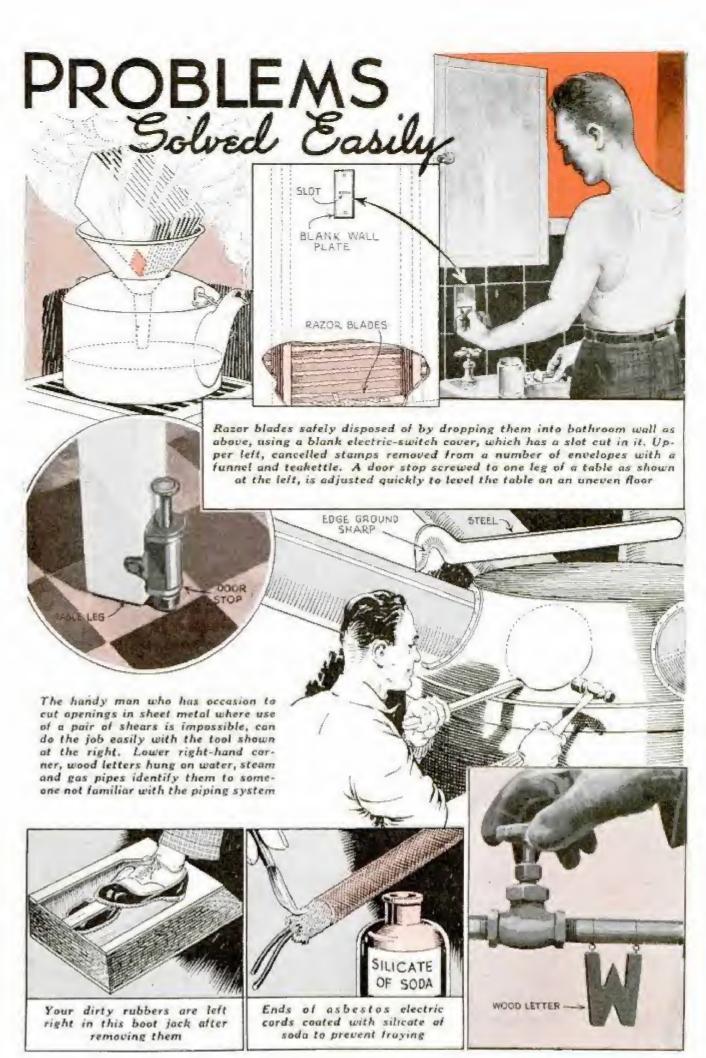

#### Film Rolls Used in Developer Tabulated on Bottle Neck

The use of rings on the necks of developer bottles to indicate the number of rolls of film that have been developed is much simpler than the usual constant changing of labels or figures. The rings shown are

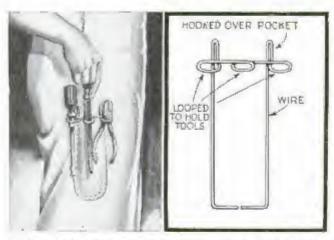

1¼-in. conduit locknuts, but any ring will serve, even those made from wire clothes hangers.—H. J. Kennard, Gonzales, Tex.

#### Capacity of Trouser Rule Pocket Increased by Wire Insert

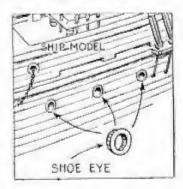

Wire insert enables you to carry several tools in the rule pocket of your overalls

To increase the capacity of the rule pocket in his overalls so that long tools such as files, screwdrivers, etc., could be carried in addition to his folding rule, an electrician employed a wire insert bent to the shape indicated. It fits snugly into the pocket, yet is easily removed.

### Port Holes for Ship Models

Modelmakers who like a finished effect on their work but have limited time and equipment, will find that shoe eyes can be used sometimes to provide realistic port holes

for ship models. First cut the eyes out of some old shoe. Then carefully select a drill that is just a trifle smaller than the inner rim of the eye. After boring the holes in their proper places in the hull, carefully tap the eyes in place.

# Speedy Model Boat Travels Circular Course

This 32-in. motorboat, powered by midget gas engine, develops speed of 20 to 25 m.p.h. on circular course. Set of four blueprints, Nos. 906 to 909 inclusive, which includes full-size frame patterns and all necessary constructional details, will be sent postpaid upon receipt of a \$1.00 remittance.

#### OTHER SUMMER PROJECTS

SECTIONAL ROWBOAT-905: Length 12 ft., beam 4 ft. Three sections occupy space only 6½ ft. long when nested. 25c.

Blueprint Department, Popular Mechanics Magazine, 200 E. Ontario St., Chicago

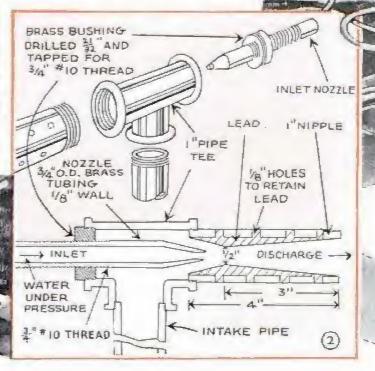

WATER-OPERATED EJECTOR drains tanks and cisterns

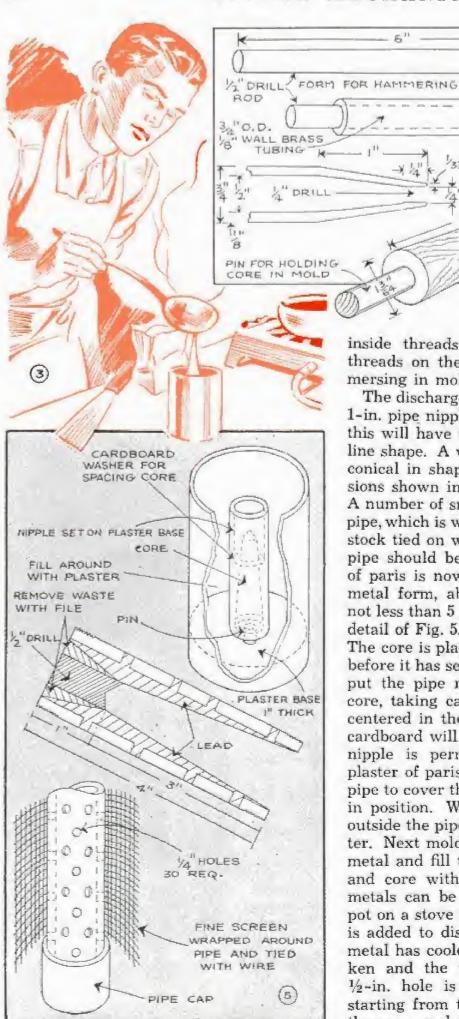

WHEREVER water pressure is available, cisterns, tanks, cesspools, and the like can be drained easily and rapidly with this ejector. Steam under pressure can be used in place of water as a

source of power.

Fig. 1 shows how the ejector operates on city water pressure and lifts water several feet. The operating parts are shown in Fig. 2. The water inlet nozzle is made from a length of ½-in. inside diameter heavy wall brass tubing. A piece 5 in. or longer should be used. The end of this tube should be hammered to shape over a form such as is shown in the upper details of Fig. 4. The hammering is started about 1½ in. from the point, working around the tube and gradually to the tip. After the nozzle has been hammered to shape, the end is smoothed down with a file. The inside diameter of the nozzle tip should be about ¼ in. The nozzle is threaded for the greater part of its length using a ¾-10 standard machine screw die. The nozzle is fitted into

a standard 1-in.
pipe tee by means
of a brass bushing,
which is threaded
to fit the tee on
the outside and
drilled and tapped
to admit the nozzle
in the inside. The

inside threads on the bushing and the threads on the nozzle are tinned by immersing in molten solder.

ÉND OF TUBE IS HAMMERED TO TAPER OVER FORM

HARDWOOD

CORE FOR CASTING

DISCHARGE TUBE

The discharge pipe consists of a standard 1-in, pipe nipple, 4 in, long. The inside of this will have to be built up to a streamline shape. A wooden core, 3 in. long, and conical in shape, is turned to the dimensions shown in the lower detail of Fig. 4. A number of small holes are drilled in the pipe, which is wrapped with a sheet of shim stock tied on with wire. The inside of the pipe should be clean and bright. Plaster of paris is now poured into a wooden or metal form, about 4 in. in diameter and not less than 5 or 6 in, high as in the upper detail of Fig. 5. An empty tin can will do. The core is placed vertically in the plaster before it has set. When the plaster has set, put the pipe nipple in place around the core, taking care that the core is exactly centered in the pipe. A washer cut from cardboard will serve as a spacer until the nipple is permanently located. Enough plaster of paris is then poured around the pipe to cover the threads and lock the pipe in position. When this has set, the form outside the pipe should be filled with plaster. Next mold some lead, solder, or type metal and fill the space between the pipe and core with the molten metal. These metals can be melted in a seamless iron pot on a stove or gas plate if a little borax is added to dissolve the dross. When the metal has cooled, the plaster mold is broken and the wooden plug removed. A ½-in. hole is drilled through the lead, starting from the mark left by the tip of the core, and then the lead is cut to the shape shown in the center detail of Fig. 5. The lead surface should be smoothed and slightly rounded, at the throat of the tube.

A length of hose or pipe having an inside diameter of not less than 1 in. should be fastened to the side arm of the tee to reach down into the sump or pit being drained. It is wise to fit the end of the intake tube with a strainer as shown in the lower detail of Fig. 5. The end of a length of 1-in. pipe is capped and not less than thirty ¼-in. holes are drilled in the pipe. A piece of wire screen is wrapped around the pipe and tied in place with wire.

The ejector now can be tested. Work the nozzle into its bushing so that the tip of the nozzle is about 1/4 in. from the lead surface in the discharge tube. The suction tube is inserted into a tank and the water inlet is connected to the water supply. The discharge pipe should be led to a suitable drain. When the water has been turned on, the position of the nozzle can be adjusted by screwing it farther in or out of the bushing until maximum flow is attained. When this point has been found, the ejector is disconnected and drained, then a blowtorch is turned on the bushing. This will sweat the nozzle to the bushing so that they will be maintained in the proper place. Be careful not to let solder flow into the threads between the bushing and the tee, as this joint is to be opened when the ejector needs cleaning.

### Honey Serves as Belt Dressing

Honey provides a better belt dressing than most others of home-produced origin. It affords excellent traction, and when it eventually dries, turns to sugar and drops off the belt. This is desirable as so many homemade belt dress-

ings build up layers of material on both belt and pulley. The honey should be heated until very thin, and it is then applied sparingly and uniformly, which can be done by means of a small brush.

-R. O. Lissaman, Brandon, Man., Can.

# Grocer Distributes Clothespins with His Handbills

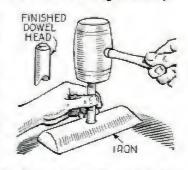

Sales circulars folded in clothespins and distributed attract attention of women buyers

One grocery store uses ordinary wood clothespins to serve a double purpose when putting out sales circulars. The sheets are folded and tucked into the clothespins, which are distributed from house to house. The pins are prized by women, who are more likely to read the circulars than if they were passed out in the regular way. Another advantage of the pins is the weight they add to the bills which makes it easy for the delivery boy to toss them onto porches, even when it's windy.

—Dale R. Van Horn, Lincoln, Neb.

#### Rounding Dowel Ends Quickly

When a number of dowels have to be sanded slightly on the end to permit driving them into tight holes, operations are slowed up considerably. A fast

method is to drill a hole into an iron block, place one end of the dowel in this depression, and strike it sharply with a mallet. Any featheredge remaining after sawing the dowel will be forced inward, the dowel assuming the shape shown.

#### Insulation Removed from Wire by Double Saw Knife

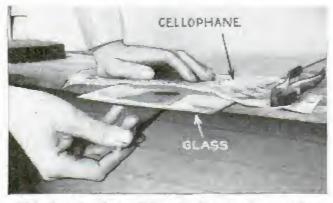

"Sawing off" heavy insulation on wire for connections is easy with this tool

Removal of heavy insulation from electric wires for soldered connections is speeded up with this tool, especially when one is working at the top of a pole. It is assembled from blocks of wood and two pieces of hacksaw blade. By using the tool as a saw at two or three angles on the wire, the insulation is rapidly severed so that it can be scraped away.

#### Eyes Protected with 'Cellophane' When Cutting Glass

If goggles are unavailable to protect the eyes when cutting glass, a sheet of Cellophane laid over the work while breaking the glass will do the trick. Eye protection

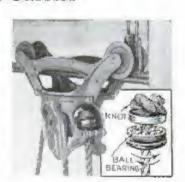

Old glass tends to "throw" slivers when cutting, thus making it advisable to protect the eyes

is especially necessary when cutting old glass, which becomes brittle with age and throws slivers upward when tapping it over a scored line to break it.

#### Hay Rope Kept from Twisting at the Carrier

The annoyance of having a hay rope twist between the fork and the end where it is fastened to the carrier can be avoided by using a ball-bearing at this point as indi-

cated. The end of the rope is run through the bearing and knotted to prevent it from pulling out. When the weight comes on the rope the bearing rests against the carrier where the knot in the rope normally rests.—I. W. Dickerson, Charles City, Iowa.

### Turnbutton Locks Gate Hook

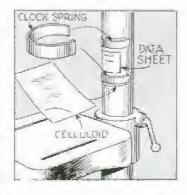

One farmer who experienced trouble by having livestock lift gate hooks with their noses, solved the problem by screwing turnbuttons to the posts just above the hooks as

indicated in the photograph. The hook can be raised when the button is in a horizontal position.

#### Data Sheet Handy on Drill Press

In a number of varied operations on a drill press in a small factory, a pair of clock springs and a sheet of celluloid were used to hold the data sheet on the drill-press post. This could be

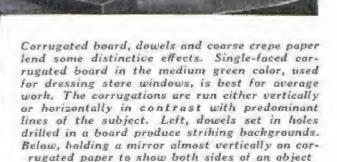

moved up or down to suit the operator, the celluloid keeping the sheet clean.

NOVEL BACKGROUNDS for close-up photos

In the photo above, a spotlight was set overhead and a floodlight was placed near the camera to soften the shadows

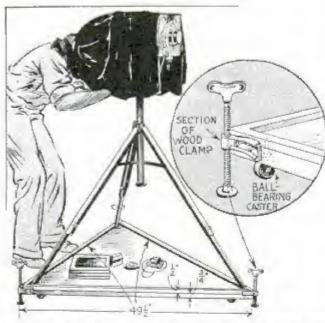

Magazine and lamp above were photographed against coarse crepe paper stretched on a table top, with a spotlight placed to partly face the camera and direct the light slightly downward on the subject, Right, size of shadows can be controlled to assume various proportions in relation to actual subjects photographed to emphasize an idea

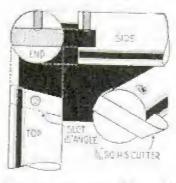

#### Camera Tripod Set on Platform Is Portable in Studio

Castered platform supports camera tripod and can be moved to any part of the studio

For studio work, this triangular platform eliminates juggling of the camera as both it and the tripod can be moved. The platform consists of a bottom of 34-in. hard-pressed board to which 1/2-in. rails are nailed to prevent the legs of the tripod from slipping. Ball-bearing casters at each corner make the platform movable. To steady the camera while taking a picture, screw-type legs at the corners are turned down to support the weight of the entire unit. Each leg consists of a screw and part of one of the jaws of an old C-clamp or regular woodworker's clamp. The method of attaching these screws is shown in the circle.-S. J. Smith, South Bend, Ind.

#### Making a Boring Tool

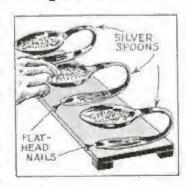

Here's a lathe boring tool that will make a cut % in. deep without chattering. A piece of ½-in. cold-rolled steel is slotted on the end to receive a high-speed cutter bit

%6 in. square. The slot should be cut at a slant of from 12° to 15° so that when the cutter bit is in place the cutting edge will have a slight lead on the bar to prevent

binding. A ¼-in, setscrew locks the bit in place, the end of the bar being ground off to the same angle as the bit. A bit ¾ in, in length will be found the shortest possible as the setscrew head projects above the surface. A second bit 1 in, long will bore up to 1¼ in. If larger holes are necessary, a piece of ¾-in, shaft should be used. The rear portion of the shaft is flattened for use in the tool post.

#### Jeweler's Small-Parts Holders from Tablespoons

Bent to the shape in dicated, cheap tablespoons provide good holders for screws and other small parts on a jeweler's workbench. The handle ends of the spoons have

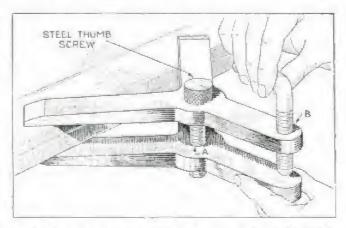

V-cuts to slip under large flat-head nails driven into a rack so that they can be removed as desired.

-A. S. Wurz, Jr., Rockyford, Alta., Can.

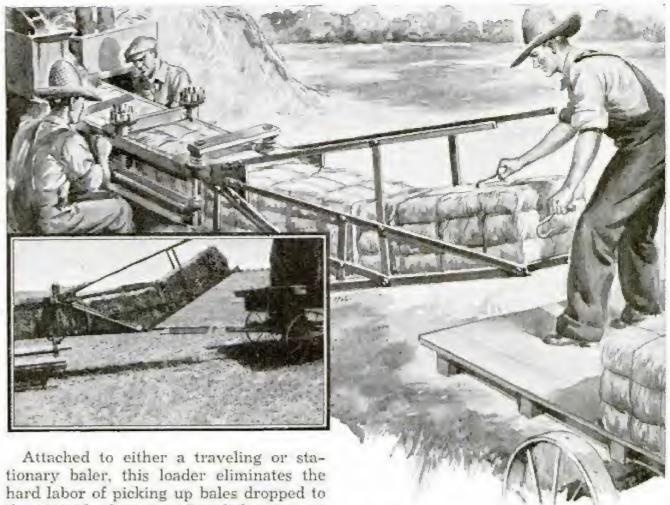

#### Handy Splayed-Jaw Clamp

This is an unusual type of clamp that can be applied in a jiffy over a wide surface, and often does the work of two clamps. It consists of two identical pieces, the drilling and tapping of the holes being a little different in that only one hole is tapped in each jaw, the lower one at A and the upper one at B. This permits the clamp to be adjusted rapidly as both screws are operated from one side.

This clamp covers a wide surface, is adjusted quickly, and often does the work of two clamps

# Hay Delivered from Baler Directly to Wagon

Attached to either a traveling or stationary baler, this loader eliminates the hard labor of picking up bales dropped to the ground. On a traveling baler it saves time lost in going back over the field to gather the bales, and when baling from a stack or barn, it saves labor by loading them directly onto trucks or wagons. It is constructed of flat or angle iron and includes a hitch for towing a wagon. The

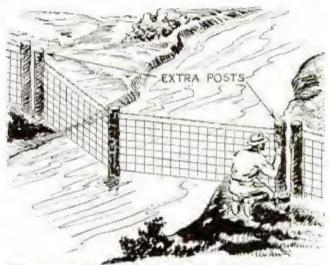

divider blocks between the bales ascend the loader and the workman on the wagon returns them to the operator by sliding them down between the two top members of the loader which are converted for the purpose.—Stanley Russell, Vincennes, Ind.

### Short Fence Across Creek Saves Main One During Flood

To avoid rebuilding several rods of fence across a creek after a flood, a farmer builds an individual, short fence across it as indicated. The regular fence stops at each bank of the creek and a couple of extra posts are set close to the regular end posts to support the short fence, which is all that has to be repaired after a heavy rain has raised the creek to flood stage.

-James Vick, Winterpock, Va.

(IA dab of thick grease on the end of a matchstick will often solve the problem of replacing an awkward cotter pin as it will stick to the grease and then can be maneuvered into the hole.

When a creek is flooded, the short section of fence washes out without damaging the main one

#### Tools Carried on Implements in Rubber Kits

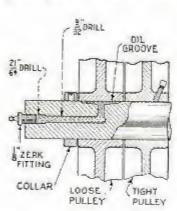

Tool kit from inner-tube on wheelbarrow or farm machinery prevents loss and costs nothing

A section of old auto inner-tube with a short slit in one side and nailed to the tongues of farm implements or stretched between the handles of a wheelbarrow, provides a dandy kit for small tools. The slit enables you to remove or replace tools quickly, yet prevents them from falling out.

#### Grease Fitting on Countershaft to Lubricate Loose Pulley

Difficulty of lubricating loose or idler pulleys that are constantly in motion is

overcome by means of a grease fitting in the shaft. Drill a 21/4-in. hole to a depth of 1 in. in the center of the projecting shaft end, and continue the hole with a 1/2-in, drill to a point under the center of the loose-pulley hub. Then

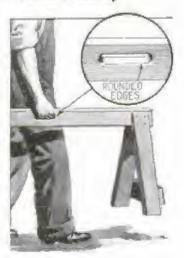

drill from the side of the shaft until both holes meet. Tap the hole in the end of the shaft with a 1/8-in. pipe tap and insert a Zerk fitting or a grease cup. The loose pulley now can be greased at will, elimi-

nating the possibility of machine damage due to the pulley running dry and freezing to the shaft.

—Grant O. Loader, Newcomerstown, O.

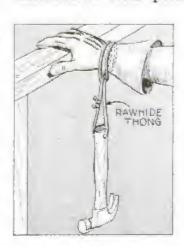

#### Handholes Cut in Sawhorses to Carry Them Easily

Carpenters and others who have to work with saw-horses will find that holes cut in the cross members as indicated simplify carrying them. The holes should be rounded and sanded at the edges to avoid getting splinters in the hand.

#### Hammer Slung from Wrist to Avoid Dropping It

When working on a building above a sidewalk or other place where it is neces-

sary that every precaution be taken to avoid dropping a hammer, the workers of one construction company sling their hammers from their wrists with rawhide thongs. These are run through holes drilled at the end of the hammer

handles, then doubled and looped around the wrist, being long enough so that they do not interfere with using the hammer.

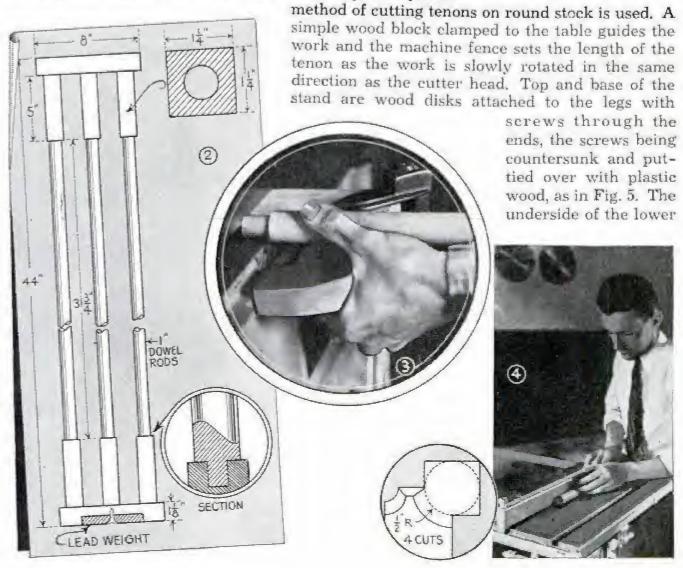

#### 1937 INDEX

for Craftsman, Shop Notes and Radio sections is now available and will be sent upon receipt of ten cents. Please do not send coin. Address Book Dept., Popular Mechanics Magazine, 200 East Ontario Street, Chicago.

# Modern PLANT STANDS in Wood, Metal and Plastic

COMBINING lustrous plastic or gleaming metal with a bone-white finish on wood, these smart plant stands add a modern touch when placed in front of a window, at either side of a bay or in a hall. While they can be assembled entirely of wood, a pleasing distinction between the legs and the bases can be had by using metal or plastic for the uprights. The stand shown in Fig. 1, and dimensioned in Fig. 2, is all wood. The legs can be turned from square stock, but it is easier to use standard 1-in. dowel rods, as turning such slender pieces is rather difficult, due to distortion, and requires a distance of at least 42 in. between centers. In joining the square ends of the legs at top and bottom to the dowels, one of two methods is used. Tenons may be formed on each end of the dowel as shown in Fig. 3. or 1-in. holes are bored to a uniform depth in the ends of the square members to take the dowels. In Fig. 3 the jointer

disk first should be recessed % in, deep and 5 in, in diameter for the insertion of a lead weight. For this you use about 5 lbs, of molten lead poured into a sand or wood mold as shown in Fig. 7. Drill three or four holes through the weight and fasten it in place with brass screws.

The top and lower bases of the design shown in Fig. 6 consist of two disks each of ¾-in. stock glued firmly and screwed together. Here you will need 42-in. lengths of stock for the legs. As standard

dowels of this length are not available, unless you prefer to cut them on a molding head or shaper, Fig. 4, ¾-in. chromium tubing may be used in contrast to a top and bottom of wood finished bone white. Before painting the wood, smooth it to a glasslike finish, using first medium coarse and then very fine sandpaper. Apply a light coat of thin paint as a primer, sand it lightly when dry, and follow with

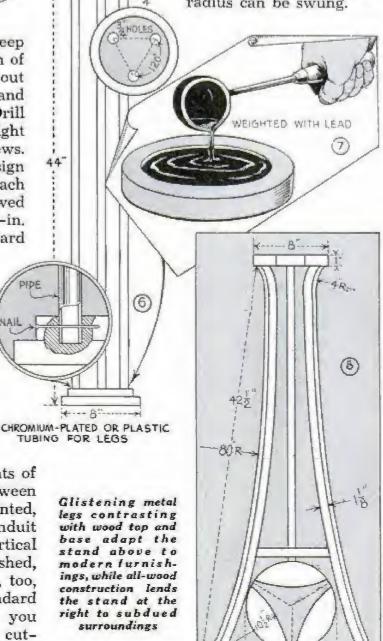

the finish coat. If more than two coats of paint are desired, sand lightly between each coat. If the stand is to be painted, thin-wall galvanized, electrical conduit can be used to good advantage. Vertical uprights of crystal plastic, highly polished, will produce a striking effect. Then, too, where massive lines are desired, standard 1%-in. curtain-pole stock provides you with material requiring nothing but cutting up to correct lengths. Pipe uprights are anchored to the wood bases simply by

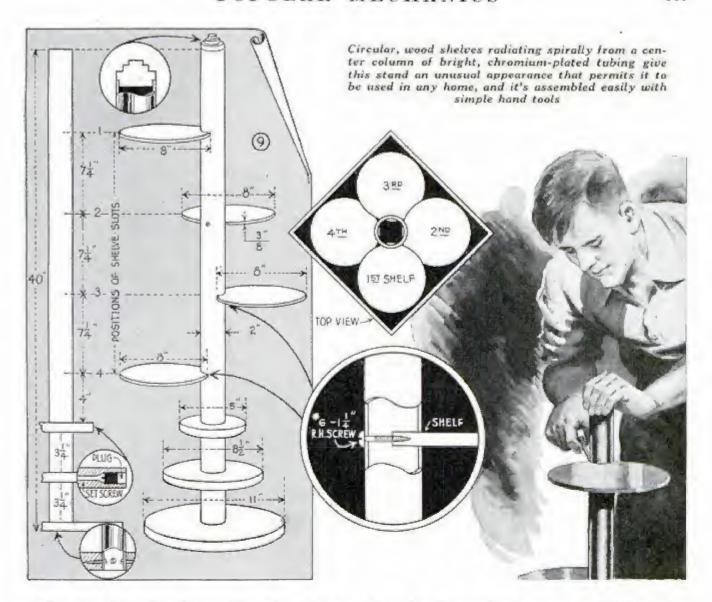

boring holes ¾ in, deep, triangularly spaced, and driving finishing nails through the edge into holes drilled through the pipe as shown in the detail at Fig. 6. Also, it's a good idea to drill a small hole through the edge of the base to avoid splitting it with the nail.

The design with curved uprights, in Fig. 3, requires more time to construct. Bandsawed from ¾-in, flat stock, the legs are supported at the bottom with a triangular-shaped stretcher and fitted at the top with either an octagonal-shaped block or one with a simple turned edge. The contour of the legs

can be marked best by laying the work out on the floor where a large radius can be swung.

STRETCHER . 82 DIA

The stand in Fig. 9 provides place for a number of plants on shelves radiating spirally from a center column of chromium tubing. Slots to support the plywood shelves are cut % in. deep in the column with a hack saw, and squared up with a file to take the shelves, to be inserted snugly. Screws driven in at the back hold them firmly to the column. This work must be done carefully so that the shelves fit the slots tightly, otherwise the weight of the plants may tend to pry them loose. Care must be taken when drilling the pipe behind the

slots for the anchoring screws. If the holes fail to line up with the centers of the disk edges, the screws are likely to split them. Three receding disks of ¾-in. plywood form the base of the stand and are fastened as shown in detail. The edge of each disk is counterbored deeply, after which the hole is continued with a small drill to the hole for the column in the center. A brass wood screw is driven in to contact the column, after which the hole in the disk edge is plugged with wood. The top of the column is capped with a turned plug.

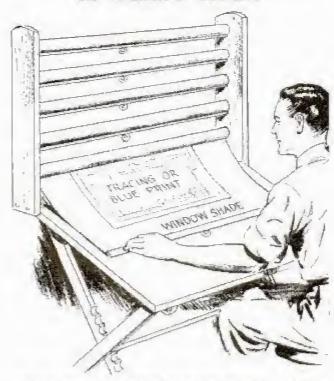

## Fresh Fish Preserved in Wet Sawdust for Transporting

Fishermen, who must travel some distance to and from the lake or stream in which they wish to ply their art, often find it difficult to preserve the catch in a satisfactory degree of freshness without the use of ice. If the fish are dressed at once, after catching, and packed in wet sawdust, they will retain their freshness for several

hours, and even more. If spring water is available, the sawdust should be dampened thoroughly with this, but water of the normal temperature of the lake or stream will serve the purpose. The sawdust should be carried in some container which will exclude the air as much as possible.

-G. E. Hendrickson, Argyle, Wis.

#### Tracings or Blueprints Stored in Window Shades

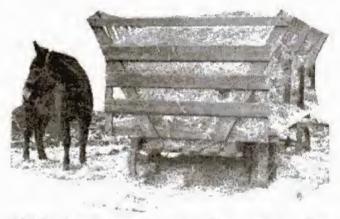

Artist heeps unfinished tracings stored safely by rolling them up in window shades

A number of window shades with their rollers mounted between vertical supports as shown, provide handy places for storing blueprints, unfinished tracings, and similar work. In use, a shade is unrolled, the tracing or blueprint laid on it and rolled up with the shade.

—D. A. Cason, Dallas, Tex.

#### Wheeled Feed Rack Hauls Hay Right from the Field

Resembling a regular hayrack, this feed rack can be set on the wagon, which is taken to the field, loaded and returned to the feed lots, thus saving the time to pitch

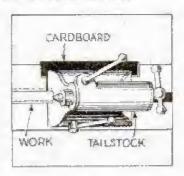

This feed rack prevents waste of hay, and also eliminates pitching feed from wagon to rack

the hay from the wagon to a regular rack. The bottom is built of solid boards which extend to the lower edges, although the sides taper inward toward the bottom at a 30° angle. The owner estimates that about one-third of the hay is saved which would ordinarily be pulled out and trampled underfoot from a regular hayrack.

#### Lathe Set to Cut Small Tapers with Piece of Cardboard

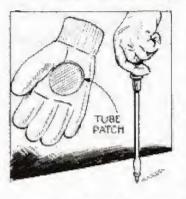

When a slight taper is to be cut on mandrels, etc., the lathe can be set for the job by merely inserting a strip of cardboard under one side of the tailstock. The amount of taper is

determined by the thickness of the cardboard, which tilts the top of the tailstock to one side as indicated by the dotted lines.

-H. Harrison, Woodstock, Ont., Can.

#### Inner-Tube Patch on Glove Palm Aids in Using Screwdriver

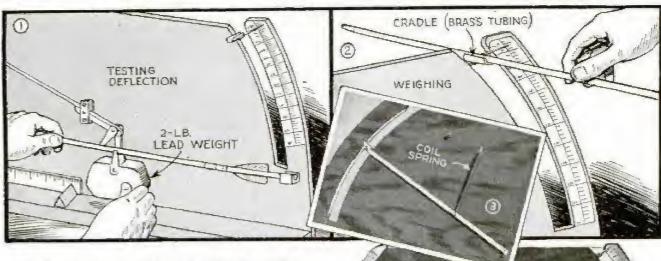

To facilitate the use of a screw-driver when wear-ing cotton gloves, one mechanic puts an inner-tube patch in the palm of one as indicated. The heel of the screwdriver bears against the patch

where it tends to cushion the hand and provide friction in gripping the screwdriver.

# Protecting Exposed Instruments on Motorcycle

The difficult problem of preventing water from passing around the glass covers of speedometers, ammeters, and other exposed instruments on a motorcycle, is solved by coating the joint between the glass and metal with cellulose cement. The cement can be made by dissolving celluloid chips in amyl acetate to form a thick paste.—Ivan J. Stretten, Detroit, Mich.

# Arrows Matched on This Homemade Tester

Both amateur and professional archers who make their own arrows, will find that this simple instrument saves time and helps to match a set of arrows as to weight, balance and spine. It consists of a narrow base nailed to a wide panel at right angles, three scales being attached to the panel as in Fig. 4. A pointer pivoted in the center of the panel, with a 2-lb. weight at the short end and the long end reaching to a deflection scale, is used to test the spine as indicated in Fig. 1. The arrow is placed between two brackets, after which the amount of deflection caused by the weight of the lead is shown on the scale. A pointer pivoted to the back of the panel and held by a spring, as indicated in Fig. 3, works with the weight scale as in Fig. 2. Note that the panel is slotted next to the scale and the pointer end bent to work in it so that the reading can be taken from the front, A short piece of tubing split in half and soldered to the pointer serves as a cradle to hold an arrow while weighing it. The balance scale at the bottom of the panel is merely a 1-ft. rule held beside a wedgedshape piece of wood to serve as a knifeedge pivot on which the arrow is placed to find its center of balance, Fig. 5. The rule serves as a guide in selecting arrows that balance the same distance from the pointed end. As all tests with the instrument are comparative, the scales can be calibrated as desired. To use the instrument, one arrow is tested on it, after which others are tested until a set is found that has the same weight, balance and spine.

-Clement C. Parker, Norristown, Pa.

### Life of Rubber-Glove Fingers Extended with Tape

WEIGHT

(4)

When rubber gloves are worn while picking up objects with the fingers, the balls of the fingers and thumbs wear quickly, rendering the gloves useless. In-

(3)

BALANCING

stead of trying to repair them, it is better to protect the finger tips beforehand by applying small pieces of adhesive tape. The tape will re-

ceive the wear and is easily replaced. This method is used regularly by a photographer who handles glass plates in developing and fixing solutions.

#### Sweet-Potato Vines Cut Quickly with Horse-Drawn Sled

Sled with mower-sickle sections on runners cuts sweet-potato vines for removal before digging

Cutting sweet-potato vines between the rows before digging them, is simplified with this sled, which is pulled between the rows. Sections of a mowing-machine sickle, screwed to the sides of the runners near each corner, project below them and cut the vines. The sled should be wide enough to just clear the potato hills. If necessary to weight the sled, the workman can ride on it.

#### Truing Lathe Center

When a lathe center has to be trued up without the use of a compound rest or when the rest has been set and cannot be

disturbed, a tailstock center can be employed to guide the tool. A bent tool holder is used with the heel resting against the rear side of the tailstock center. Now if the saddle is moved up as the

cross slide is moved outward, and the heel of the tool holder is kept in contact with the tailstock center, the tool will be forced to follow the same path and produce the same taper on the center being turned.

-H. Moore, Leeds, England.

#### Number of Month on Calendar Saves Time

Typists, clerks and other office workers who often have to refer to a month by number, can save time by marking the number of the month in large figures on the calendar. A glance will show

the number of month without having to count back as is often the case.

#### Armored Cable Cut Smoothly Through Tape Wrapping

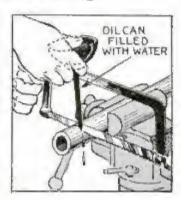

To avoid ragged edges when cutting armored cable with a hacksaw, wrap a piece of friction tape around the cable at the point where it is to be severed. Then cut through

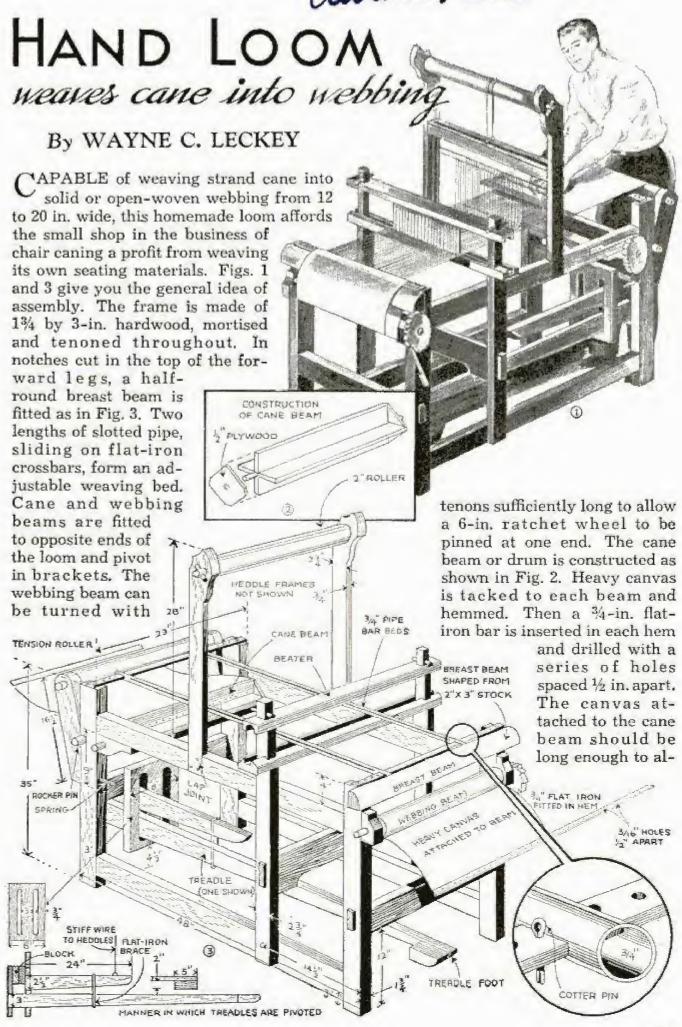

both tape and cable. The tape is removed in a moment and the edges will be found clean, which makes it easier to work with when placing an electrical fitting over the end.—H. R. Wallin, New York.

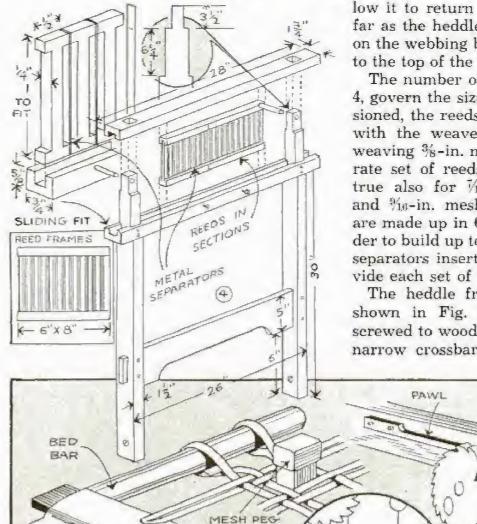

#### Water Will Lubricate Hack Saw for Lead Cutting

A Wisconsin plumber declares that oil never should be used to lubricate a hack saw when cutting lead. A small oilcan filled with water should be kept readily at hand for such work.

aurora, dell.

USE OF MESH PEGS

NESH

7" MESH

low it to return over the weaving bed as far as the heddle uprights, Fig. 1. Canvas on the webbing beam should reach at least to the top of the breast beam.

The number of reeds in the beater, Fig. 4, govern the size of the mesh. As dimensioned, the reeds are used for ¼-in. mesh with the weave termed as "Fine." For weaving ¾-in. mesh, "Superfine," a separate set of reeds must be made. This is true also for ¼6-in. mesh, "Fine-Fine," and ¾6-in. mesh, "Medium." The reeds are made up in 6 and 8-in. sections in order to build up to the desired width. Metal separators inserted between the reeds divide each set of horizontal strands.

The heddle frames are constructed as shown in Fig. 9. Angle-bent flat iron screwed to wood stretchers and fitted with narrow crossbars 16 in. apart forms the

> frame in which the heddles are suspended on twisted wires. The frames move up

RACHET ON WEBBING BEAM

and down alternately on a roller support, Fig. 3.

A roller tension beam fitted to the rear of the frame, Figs. 3 and 6, gives, each time the strands are elevated, to prevent breakage. Fig. 3 gives

dimensions for the treadles.

SPRING

Begin threading up the loom by tying the strands to the canvas of the cane beam as shown in Fig. 8. Starting in the center of the beam, insert two strands through the hole and tie securely. Then thread one strand through the rear heddle and the other through the front heddle, both strands starting from the same hole in the

SEGIN THREADING

CENTER HOLE

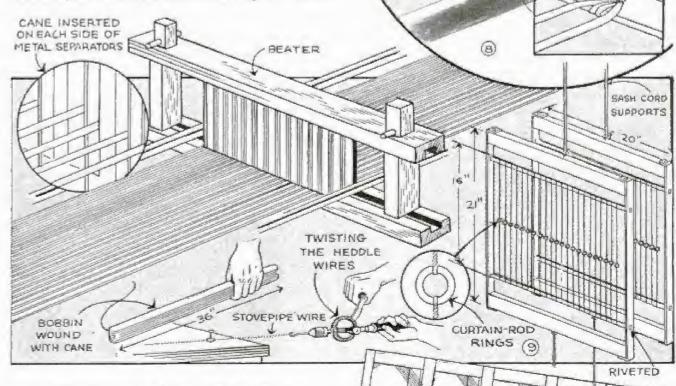

TWO STRANDS IN

EACH HOLE

canvas. Proceeding forward, insert the strands through the center reed of the beater, one on each side of the separator. When the correct number of strands have been threaded through likewise, the strands are drawn out their full length, Fig. 7, and clamped. With an assistant, the cane is then reeled in on the cane beam to a point where the wooden clamp will drop down behind the breast beam. The loose ends are tied to the canvas on the webbing beam before the clamp is removed. Engage the pawl in the ratchet to bring the cane sufficiently taut, but not too great.

The loom is now set for weaving. Mesh

The loom is now set for weaving. Mesh pegs, corresponding to the size of webbing desired, are used as shown in Fig. 5. These

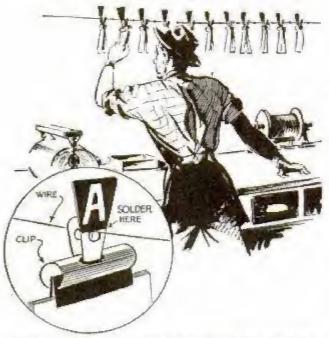

space the horizontal strands as the weaving progresses. Now to weave. First, elevate the heddle then, with the cane tied around the bed bar, pass the bobbin through between the two diverging sets of vertical strands and loop around the bed bar on the opposite side. Seeing that the glazed side of the cane is upward on the return weave, reverse the treadles and pass the bobbin through as before, looping around the pipe bars as in Fig. 5. Then with the beater, crowd the weave snugly together. The weaving of the horizontal strands is continued in this manner, using the mesh pegs, for a distance equal to the width of the webbing exclusive of its marginal ends. At this point, the diagonal strands, Fig. 10, must be woven in by hand.

The dark lines in Fig. 10 show how this is done. When these strands are in place, the looped ends around the bars are cut and the webbing so far woven can be reeled in on the webbing beam and the operation repeated. Except for the amount of cane lost in threading the beams, there is practically no waste as short strands can be used later as weavers.

WEAVING STEP

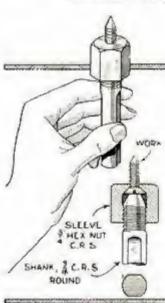

# Alphabetical Bill File on Wire over Shipping Bench

This shipping clerk has alphabetical file for bills right above his head

Shipping clerks and others who have to handle quantities of bills and invoices will find this alphabetical file convenient. It is stretched between walls above their bench where the papers can be reached instantly. The file consists simply of a number of paper clips of the type shown, which are strung on a wire. Pieces of sheet metal bearing the letters of the alphabet are soldered to one handle of the clips as indicated in the circular detail.

#### Holder to Clamp Screws in Vise While Shaping Ends

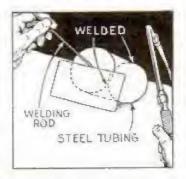

On jobs that require pointing ends of a number of machine screws, this simple holder will grip them tightly so that they can be clamped in a vise. It consists of a piece of steel rod flattened on two sides at one end and threaded at the other to take a sleeve, which is made from a short

piece of hexagon stock. The sleeve is drilled out and tapped so that it will clamp the screw head against the beveled end of the rod. The portion of the sleeve that contacts the screw head is counterbored to the same bevel as that of the head.

-Michael Wolf, Minneapolis, Minn,

#### Container for Soldering Flux

Welders will find this container unusually handy because it sets at an angle so that the flux can be reached easily with the welding rod. It consists of a short piece of large tub-

ing with a metal disk welded to one end to close it, and a rectangular piece welded to the other end to cover half the opening, the piece projecting over the edge to serve as a support when the container is set on a bench.

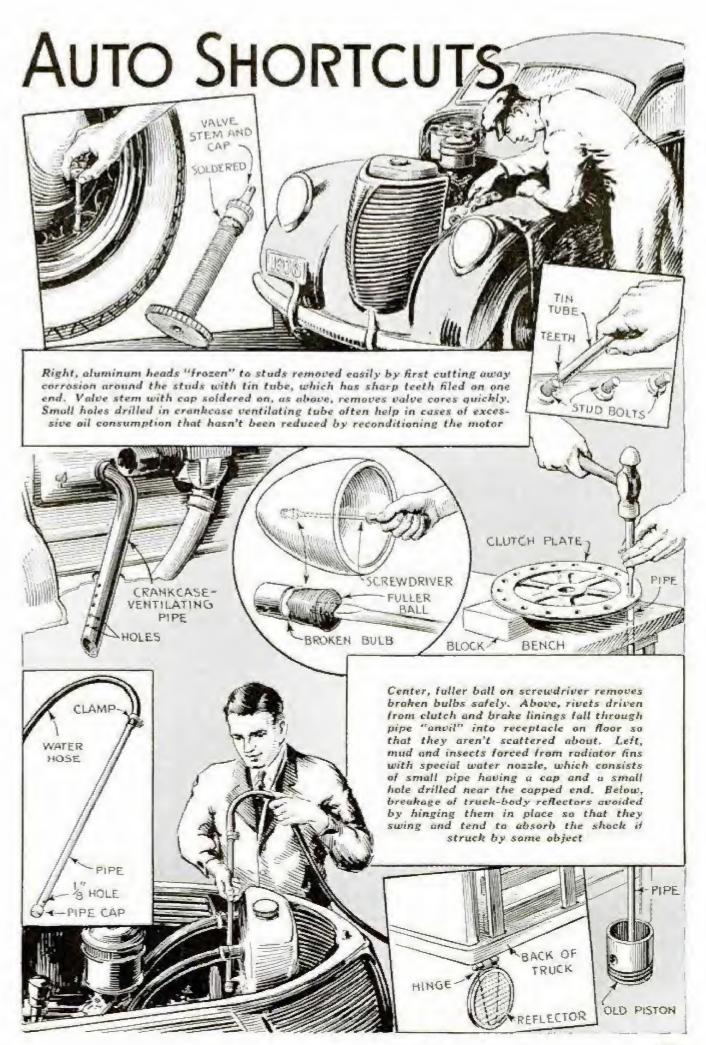

-W. R. Maddex, Richmond, Ind.

#### Boards Laid Across Fence Corner Provide Simple Sunshade

When there is young livestock on a farm, it will often pay to erect a number of these sunshades for use on hot days. If the fences around the cattle yards are wood, so much the better. You need only lay old boards across the corners as indicated in the photo, a single nail through the end of each board holding it in place.

Boards laid across top of fence at corners provide ideal sunshade for young cattle

#### Small Funnel Holds Compound to Grind Valves

A small funnel with a cork in the spout keeps valvegrinding compound conveniently at hand

To hold valve-grinding compound conveniently at hand, one mechanic employs a small funnel. A cork closes the spout, which is inserted in one of the bolt holes of the engine block to hold the container erect and prevent it from tipping over.

#### Increasing Life of Mud Hooks

A good way to increase the life of mud hooks is to pry open the end links connecting the cross chains with the side plates, and turn them over when nearly worn through. Do not

open the hook any wider than necessary as the metal might break when the hook is closed over the plates again.

-Henri Castonguay, Spencer, Mass.

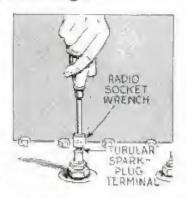

#### Assorted Shoes Equalize Brakes

The effect of one brake shoe in each pair is often greater than the other, which is due either to the lining being different, or to grease having leaked onto one and not the other. This trouble can be overcome on brakes having two interchangeable shoes. The four shoes are removed from the wheels and so assorted that one of the quick acting and one of the poorly gripping are in each drum. If the brake is of the type having the shoes mounted vertically, the good one is placed at the rear side of each drum. As the weight of the car is thrown against the front side of each drum when stopping, the good shoe in the rear half gives more friction, which is usually lacking. This plan does not increase the over-all power of the brakes. It makes all of their power usable.

—E. T. Gunderson, Jr., Humboldt, Iowa.

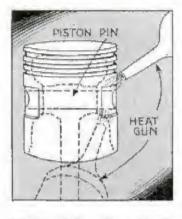

#### Tightening Tubular Terminals on Spark Plugs

For tightening or loosening long, tubular nuts on spark-plug terminals, a socket wrench of the type used to tighten knurled nuts on radios will do the job in a jiffy and without damaging

the nut. This wrench is better and quicker than a pair of pliers as the knurled surface inside the socket grips the terminal nut tightly.—Emil J. Novak, Omaha, Nebr.

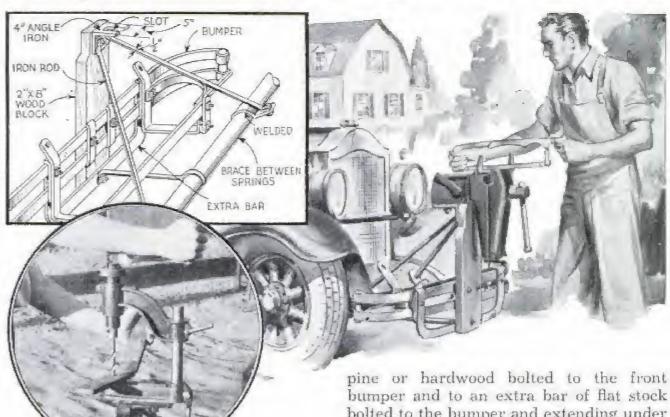

#### Shrunk-Fit Piston Pins Removed with a Heat Gun

Instead of putting a piston in hot
water or oil to expand the bosses so
that a shrunk-fit
piston pin can be
removed, try using
a heat gun. The
heat can be applied directly to
the bosses to expand them quickly

without heating the entire piston, and the job can be done in much less time than when the other methods are employed.

# Bumper Vise Stand to Repair Cars on Road

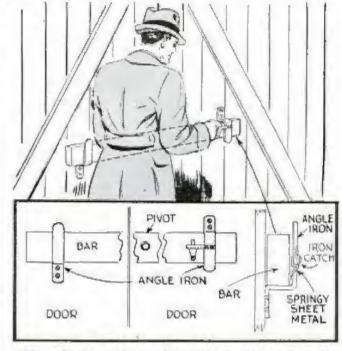

For repairing cars on the road, a California mechanic finds this bumper stand handy to hold a vise or a small hand drill press. It's just a piece of 2 by 8-in. yellow bumper and to an extra bar of flat stock bolted to the bumper and extending under it. Rigidity is obtained by reinforcing the entire assembly by means of three bracing rods, one end of these being fastened to clips welded to the tubular brace between the springs. A slotted piece of 4 by 4-in. angle iron, bolted to the upper end, simplifies attachment of tools.

## Garage Doors Made Burglarproof by Clip on Locking Bar

Garage doors that are locked by a bar pivoted to one of them, can be made burglarproof by a spring clip as indicated. This is fastened to the bar near one end to engage a projecting iron catch, which is riveted at right angles to the regular bar bracket on the door. The catch prevents the bar from being raised by a thin piece of metal pushed between the doors.

#### Poor Free-Wheeling Adjustment Causes Noisy Gears

In many cases of complaints of transmission howl and noise on the 1934 Plymouth, while driving out of free-wheeling, the trouble was found to be caused by the free-wheeling gears not meshing fully. Shortening the control rod so the gears meshed correctly stopped the trouble.

When the bar is dropped into the brackets, the catch slips over an arm so that the bar cannot be raised

#### Patching Rack for Inner Tubes from Old Spade

Old spade screwed to wall or bench provides handy support for inner tube while patching it

An old spade can be converted into a handy wall or bench support to hold inner tubes while patching them. The natural curve of the back of the blade is just right for this type of work. To attach the blade, remove the handle and, after heating the straps, bend them as shown and screw them in place. Additional rigidity can be had by riveting or welding an extra strap at an angle under the blade.

-W. C. Wilhite, Carlinville, Ill.

#### Lubricating Windshield Wipers

Wipers that are inclosed in panels above the windshield can be oiled by the vacuum line under the instrument panel. Put a few drops of oil into the line and with the aid of a tire pump force air up into the wiper.—Clifford Horne, Redgranite, Wis.

#### Storage Battery Checked for Leaks with Ordinary Compass

If you drop a storage battery or have other reasons to suspect that the cells might have been cracked so that there is an electrical leak between them, an ordinary compass can be used to make a check. Just set it on one of the connectors between the cells, and if there is current flowing between them, the compass needle will be deflected at right angles to the connector. Make two or three tests with the battery in different positions to be sure the needle is not merely pointing to the earth's magnetic pole.

#### Bugs Removed from Windshield with Wood Block

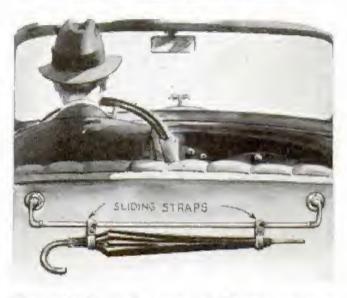

One mechanic found that wet pine blocks kept in a bucket of water near his gasoline pumps were effective for removing bugs from windshields. Fresh accumula-

tions were scraped off easily with the smooth edge of a block, while dried deposits were rubbed off with the end grain.

#### Sliding Straps on Robe Rail Hold Your Umbrella

Carrying an umbrella in the car is usually annoying, as it is difficult to find a place where it will not be in the way. If the front seat is provided with a robe rail, two leather straps may be attached to the rail to hold the umbrella as indicated.

Your umbrella is always out of the way, yet is at hand when needed if it is strapped to the robe rail

KODAK RETINA II (above) . . . Lens, anastigmat f.2.8 or anastigmat f.2.0. Shutter, 1/500 Compur-Rapid. Coupled coincidence-type range finder. Body shutter release. Double-exposure prevention device. Kodak Retina II, f.2.8, \$115; Kodak Retina II, f.2.0, \$140. Prices include sportsman's field case.

KODAK RETINA I (not illustrated) . . . Lens, Kodak Anastigmat EKTAR f.3.5. Shutter, 1/500 Compur-Rapid. Film-measuring mechanism. Exposure counter. Depth-of-focus scale, Price, \$57.50.

## 'Gentlemen Drivers"

(Continued from page 229)

dry them out helps a balky engine, and many drivers carry an extra set of spark plugs in a dry place in case they are needed.

Three or more different shapes of propellers are in most drivers' kits. A small propeller gives the best speed in calm water but rough water, which is faster, calls for a propeller with more pitch. A propeller with plenty of pitch gives the highest speed in a straightaway dash but a larger propeller of smaller pitch is best for closed-course racing because its more positive bite on the water gives better acceleration. On rivers that contain quantities of driftwood drivers use steel propellers that can chop their way along without bending the blades.

Outboard racing is cheap in comparison with other speed sports. You can spend as much as \$1,500 for an unlimited "X"-class motor if you want a crack at the present world record of a fraction under eighty miles per hour, or you can get into the midget "M" class with a complete outfit, including motor, hull and trailer, for about \$300. If you build the hull and trailer you can clip a hundred dollars off that cost. Most drivers buy their hulls and do their own motor work. The "M" class requires a fifty-pound boat and an eight-cubic-inch motor and you will have to beat thirtythree miles per hour with that equipment if you want to hang up a new record.

The other hydroplanes graduate in size from the "A" class, with a 100-pound boat and a fourteen-cubic-inch motor, "B" class with a 100-pound boat and twenty-cubic-inch motor, "C" class with a 150-pound hull and thirty-cubic-inch engine, to the "F" class that requires a 190-pound hull and a sixty-cubic-inch engine. In the last you will have to do better than fifty miles per hour to win many races. The present record is sixty-two miles per hour. Other racing classes are the one and two man runabouts.

■Popular Mechanics Magazine can furnish the name and address of the maker of, or dealer in, any article described in its pages. If you wish this information, write to the Bureau of Information, inclosing a stamped, self-addressed envelope.

# Thrill Hunters of the Air Lanes

(Continued from page 253)

the sake of brevity. Sometimes, two or three minutes of dialogue will have to be added to a show. Different inflections on the lines alone often will do the trick.

In the radio programs he produces, Stuart Hawkins uses his forefinger to pace a script. Not one member of a cast so much as opens his mouth until Hawkins' finger comes down. The finger uplifted means silence. Manipulated in certain ways, it signals the timing of sound effects. In a scene where there are many characters, it moves around like a baton.

Any doubt as to the reality of radio characters in the minds of the listeners vanishes after one look at the personal letters they receive daily. A kindly boarding-house owner or a country-doctor character will receive hundreds of letters asking their advice on love problems or how to secure a job. If some dashing hero is wounded in battle, he receives remedies and suggestions for taking care of his gunshot wounds. Whenever some feminine character becomes engaged to some other imaginary character, her mail is glutted with advice on husband-taming and housekeeping.

Chicago is the script capital of the radio world. There are approximately 500 radio actors engaged in radio dramatic work. Of this number, however, approximately fifteen per cent do ninety per cent of the jobs. An actor receives from fifteen to twenty-five dollars a program for an ordinary part. Some actors and actresses have worked on as many as forty script shows in a single week but ordinarily an average week is ten or twelve appearances.

A whole bagful of voice tricks must be possessed by a radio performer. Contempt, love, anger, pity—every mood requires a corresponding tonal quality in the voice. He must be adept at reading lines or his performance will sound mechanical.

Stock companies and the smaller radio stations have been the developing ground for the majority of players, particularly those who do character work. Some of these are amazingly versatile. Forrest Lewis plays the part of young men, old men, Germans, Frenchmen, Englishmen, Hindus, Orientals, and five Negro characters. On one fifteen-minute show he plays six characters.

# NEW Non-Skid TIRE DRIES WET ROADS

... Also Gives You Golden Ply Blow-out Protection Free

Read how this new tire can save your life

WITH traffic growing heavier, with long vacation trips just ahead, right now is the wise time to replace smooth, dangerous tires with the new Goodrich Safety Silvertowns.

This sensational Silvertown is more than just a new tire—it's a NEW KIND OF TIRE! Inside it has the famous Golden Ply blow-out protection that has already saved thousands of motorists' lives. Ontside it has the amazing new Life-Saver Tread that actually dries wet roads and gives you the quickest non-skid stops that you've ever had. For tomorrow's safety—equip your car with Goodrich Safety Silvertowns today! They cost you not a penny extra.

Life-Saver Tread sweeps water right and left like a hattery of windshield wipers—actually dries wet roads.

Wins "hands down" in non-skid tests For thousands of miles over wet and dry roads the famous Pittsburgh Testing Laboratory checked the regular and premium-priced tires of America's six largest tire manufacturers to determine scientifically which tire gave greatest resistance to skids.

#### SUMMARY OF THE REPORT from America's Largest Independent Testing Laboratory

"NON-SKID—The new Goodrich Silvertown with the Life-Saver Tread gave greater skid resistance than any other tire tested including those tires listed from 40% to 70% higher in price.

"MILEAGE — The Goodrich Silvertown gave more non-skid mileage than any of the other tires tested in its own price range—averaged 19.1% more miles before the tires wore smooth.

"BLOW-OUT PROTECTION

—Despite the severe nature of
these tests, no Silvertown blew
out, or failed from any cause,
while two tires of other
makes failed."

# The Truth about Tank Farming

(Continued from page 235)

place naturally. But in the water-culture method they must be made by the operator.

The proper preparation of seed beds, tanks and nutrient solutions is only part of the problem. Knowledge and control of light and temperature, plant diseases, insect pests, plant varieties and their climatic adaptations are equally important. In short, a successful water culturist must know as much about plants as a successful dirt farmer or an expert greenhouse man.

In the welter of confusion about water culture, promoters and profiteers have seen a chance to reap a quick fortune. Many have advertised the sale of nutrient salts for water-culture solutions, making highly exaggerated claims for these chemicals—such as the power to produce crops without regard to the season of the year. One promoter offered a package of nutrient salts for \$1.25. Purchased at a chemical supply house, the same amount of salts would cost only five or ten cents.

It would be misleading to state flatly that greater yields are possible by water-culture methods than by soil methods in the same area. Greenhouse conditions are so different from those on the farm or in the garden that no scientific or practical basis of comparison exists. Yields from water culture are not so impressive when compared with the yields from greenhouses growing tomatoes in soil. Both successes and failures have been reported from greenhouses using the water-culture method of growing tomatoes. The question resolves itself to this: Is it cheaper to grow tomatoes by water-culture methods or by soil methods?

Water culture at present is for the expert. It is still in the experimental stage, and to go at it on a commercial scale without training and experience is a gamble. Ernest W. Brundin of Montebello, Calif., is one grower who has made a success of water culture on a large-scale commercial basis. He holds a bachelor of science degree from the University of California and has been engaged in patent and irrigation engineering. He started his project three years ago with the advice of Dr. Gericke.

Mr. Brundin has about half an acre under glass. In his greenhouses are 150 chemical tanks, containing 12,000 tomato plants. Temperature, sunlight and humidity are rigidly controlled, and the nutrient solution is pumped to all the tanks from one central pumping unit. No one chemical formula is used. He tests his solution every twenty-four hours to see what adjustments should be made. The plants are fed about eight pounds of salts each day—costing about three cents per pound. On cloudy days, the plants require less food than on sunny days.

Seed is planted about the first of September and the ripe tomatoes are harvested continuously from January to August. Then the plants are removed, the houses and tanks are thoroughly cleaned, and new seed is planted. Mr. Brundin's water-culture tomatoes are in constant demand by large fancy grocery stores and are also served in the dining cars of one railroad.

Mr. Brundin reports that the 1937 crop yielded at the rate of eighty-three tons per acre and sold in the wholesale market for an average price of thirteen cents per pound. This is possibly a fifteen to twenty-five per cent greater yield than that of hothouse tomatoes grown in fertile soil. More favorable prices are obtained because the fruit is harvested during dark winter days when soil-grown, hothouse tomatoes are not available. At present, the investment required for an acre of water-culture equipment will run about \$25,000 for the hothouses, and about \$7,000 for the tanks and pumping equipment.

"The person who ventures into 'chemical farming' should be guided by dollars-and-cents facts," says Mr. Brundin. "Small-scale 'experimental' tanks, as advertised by the promoters, are more difficult to operate and control than a large commercial plant. It is essential that the grower have a knowledge of testing alkalinity-acidity and nutrient balances, and know how to make the necessary adjustments."

That is the opinion of a man who speaks from first-hand experience. The truth about water culture is this: With scientific methods and expert supervision, it may succeed on a commercial scale in luxury crop production. But the commercial grower must be prepared to invest a considerable amount of money in equipment and develop his own technique with expert advice. Otherwise he may be doomed to discouraging failure.

In summer as well as in winter, Delco-Remy engineers and research men subject Delco batteries to cold-room tests at a temperature that never varies more than one degree from zero. Here, under approximate winter operating conditions, each part of a Delco battery is thoroughly checked, so that its cold-weather performance may be assured. It is this thoroughness in research and testing that assures battery users of quick starting, ample power, and long life from the Delco batteries in their cars, trucks, boats, and tractors.

Delco battery sales and service requirements are available at United Motors Service Stations and dealers everywhere,

# Cloak of Fire Guards Drop of Steel

(Continued from page 203)

is delivered from a welded underground tank at the filling station through a welded pump into the welded tank of your automobile.

Arc welding for many years was prohibited, but now is almost the universal method employed for fabricating the mammoth pressure vessels used in refineries, because it allows them to treat the raw material at extremely high temperatures and pressures, and in large volume. This modern refining equipment enables the oil industry to extract fifty per cent more motor fuel from a barrel of crude oil than was possible before the days of the shielded arc. The cut in the nation's annual gasoline bill as a result of this saving in raw material has been estimated to be more than a billion dollars, or five cents a gallon on the retail price, and the gasoline itself is rated to be fifteen per cent more efficient.

In the steam-power field, temperatures and pressures took an upward surge. It is a striking contrast to compare the hesitancy toward are welding steam pipe lines for fifteen pounds pressure in 1925, with the prevailing practice of welding pipe lines for a hundred times that pressure in 1938. The economy of it is found in the story of fuel consumption, one and fivetenths pounds of coal per kilowatt-hour in an average steam station, and eight-tenths pound of coal per kilowatt-hour in a modern high-pressure station.

Impressive also is the weight-saving advantages in shipbuilding. A 35,000-ton battleship saves a thousand tons of steel in the hull and is able to add that much to armament without sacrificing speed or violating naval building agreements. A 300-foot cargo vessel's load capacity is increased by 300 tons, thus saving her owners thousands of dollars per year, in addition to being lower in construction cost.

It is not surprising that the industrial payroll numbers increasing thousands of Class One welders. Hunched over their work like so many strangely hooded gnomes they are busy every day at fusing together some of the mightiest steel structures ever built. Often they are located behind heavy curtains to protect passersby from exposure to the sharp glare of the arc. Their work has a peculiar simplicity

of design. Pipes are joined without couplings; structural steel trusses are assembled without gusset plates; boiler drums are made without butt straps. These auxiliary connecting pieces are unnecessary because the weld is fully equal in strength to the metal which it joins.

Although this process has been fitted into the production lines of many steel fabricating plants, it is not restricted to such prosaic working conditions. One master welder may apply his sputtering arc on the bracing structure of the bottom hold of a battleship. Another straddles a beam high up in the framework of a new office building. A third is busy in the maze of high-pressure piping of an oil refinery. The immediate responsibility is always the same, to guide that tiny arc along a seam, feeding the wire downward as it melts, so as to hold the arc gap at a uniform length, and guiding the milk-white drops of liquid metal accurately into the advancing crater. All this is in spite of clumsy protective clothing, heavy work gloves and a huge black fiber helmet that completely incloses his face and lets him view his work through a window of dark glass.

The very newness of the process makes for new opportunities in many branches of engineering, new worlds for science to conquer. Improvements are yet to be made in the composition of electrode coatings and methods of applying them to wire. Electric current-control devices are in their infancy and will reward inventive genius. The subject of design for welding covers a vast new area; designing to use welded metal construction so the utmost benefit is gained from the strength and soundness of the weld metal and with the greatest possible economy of material and labor. These subjects are being discussed actively at conferences and clinics held by engineering schools, universities and technical societies in all part of the country. Those closest to arc-welding developments assert that the process is on the threshold of its most flourishing period of expansion and development.

Popular Mechanics Magazine can furnish the name and address of the maker of, or dealer in, any article described in its pages. If you wish this information, write to the Bureau of Information, inclosing a stamped, self-addressed envelope.

# BIRDS were caught STEALING GAS

All over the country, 70,000 Registered AC Spark Plug Cleaning Stations are displaying the pointed little reminder illustrated above.

In bringing dirty spark plugs to the attention of motorists, these Cleaning Stations are rendering a helpful, valuable service. For dirty spark plugs waste as much as one gallon of gas in ten, and cause hard starting and loss of power.

The dirty deposit (oxide coating, soot, and carbon) makes spark plugs misfire—especially when the engine is under load or operating at high speed. This misfiring wastes fuel, steals engine power, and delays starting. So, make it a point

to have your plugs cleanedby the AC Method - every 4,000 miles. The cost is only 5c a plug.

LOOK FOR THIS SIGN When you need plugs or

# Running the Electric Liners

(Continued from page 197)

other motors can be switched on at once to supplement the pumping.

Air conditioning the ship is one of the big tasks of the electrical department and usually the demand is for cold air to the fire and engine rooms and for warm air to the passenger spaces. Fifty-six large ventilating fans on the "Santa Paula" handle half a million cubic feet of air a minute in and out of the ship, electrical coils in the intake ducts heating the air that is drawn down into the cabins and public rooms.

You might think that the engine-room crew and the electricians would have lit-

Small lathe in ship's machine shop, where emergency repairs may be made

tle to do during a voyage when everything has been shaken down after leaving port, but that is wrong. One of the goals of modern seamanship is to prevent anything from happening that might disrupt schedules or alarm the passengers. To achieve that ideal calls for a steady routine of maintenance. On every voyage, each piece of electrical gear on board is thoroughly inspected. At the first sign of wear an element is replaced and repaired. Each six months, every pump, motor, and fixture is taken apart, cleaned and oiled, and reconditioned. The ship has a stock of \$75,000 worth of spare electrical equipment on board, carrying it for thousands of miles

on voyage after voyage on the bare chance that sometime at sea a heavy armature or some other vital part will have to be replaced in a hurry. There is no telephoning a convenient warehouse and waiting for an immediate delivery. Enough emergency cables are carried for connecting any important motor on the ship with any primary. All these spare parts are protected with heavy coats of insulating varnish to keep out corrosion and moisture.

Some large liners have electric main drives by which steam raised in the fire rooms is used to turn great turbo-generators that supply the power to big motors connected directly to the propeller shafts. But even on ships that use steam turbines for propulsion, electricity is used for practically every other purpose. Electric bake ovens and stoves in the galley, electrical refrigerating equipment, motion-picture projectors, public-address systems for musical broadcasts, and the maintenance of the different electrical fire-alarm and collision signals all must be taken care of by the seagoing electricians.

# Riding Hobby Horses to Fame

(Continued from page 189)

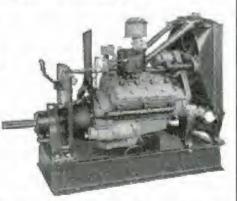

non says, is retouching. Out of 3,800 negatives exposed during 1937, but two were perfect. This means that no retouching at all had to be done on them. Even with his vast knowledge of horses, Shannon seldom makes a shot when everything is perfect. The horse may drop one ear. Its tail may be carried to one side by the wind. The rider may be doing something awkward. All such defects have to be removed by careful retouching on both print and negative. Sometimes a horse picture has to be recopied several times. When the job finally is finished, not even an expert photographer can detect where the doctoring was done. Shannon once was called upon to remove the rider from a horse and put another person, who had recently purchased the animal, in his place. He did this so skillfully that the alteration cannot be detected.

"If I spent a year telling and showing a photographer how to take horse pictures, he would go out and fail miserably," Shannon says. "It's not a matter of photography. Anyone can learn how to make (Continued to page 124A)

# CAN YOU BEAT THESE POWER COSTS?

(Continued from page 123A)

good pictures from a purely photographic standpoint. But to make successful horse pictures, you've got to know horses."

Some cameramen maintain that 1500 second shutter speed is fast enough to stop action. When it is pointed out that the horses' feet will be blurred at that speed, they come back with "Oh, you can't stop the feet anyway." Shannon's pictures prove otherwise. He has to stop the foot action, for that is one of the most important things to a horse fan. So he uses a shutter speed of 12000 second. To minimize movement and obtain sufficient depth of focus with a wide-open lens, he keeps well back. His horses cover only about one-fourth the negative area. In shooting action, he follows the horse through his view finder much as a hunter follows game with the sights of his gun. It took a long time for him to learn the psychological split-second to press the shutter release in order to catch the peak of action, which means in the case of a trotting horse, when its knee is at the highest point. By keeping back with his camera, he minimizes the possibility of shooting too far ahead of, or behind, the moving horse.

He photographs, for the most part, saddle horses, jumpers or hunters, and draft horses. The first classification provides the bulk of his work. He does very little racing work. He has learned a great many inflexible rules about the way a horse should be shown in order to please the owner. For example, a saddle horse, ninety-nine times out of 100, should be taken when it is at a trot. Otherwise it will look awkward. Incidentally, a high-class saddle horse in a pose that is declared perfect by a horse expert is likely to look awkward to anyone not familiar with horse points. The neck, for example, may seem too prominent; but to a horseman, a long, fine neck is a mark of high perfection.

Saddle horses are photographed to show the peak of action, when the knee is at its highest point. There are various additional rules for photographing three-gaited horses, five-gaited ones, and so on. Horses used for hunting and jumping are shot generally at the top of their jump. Shannon uses a low camera position in such cases, to emphasize height above ground, and to keep the horse's feet from merging with the ground or background objects.

# Raising Rabbits for Profit

(Continued from page 245)

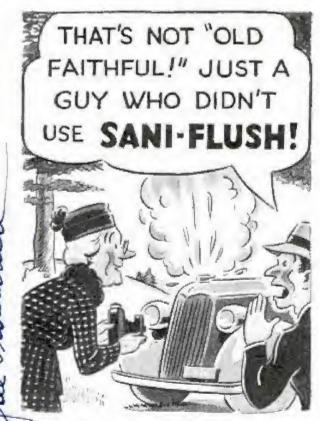

removable to facilitate cleaning and disinfecting. Some rabbit raisers use two tiers of hutches, one above the other, to conserve space, but cleaning is easier in single tiers."

Greens and water are the main items of diet, any green hay such as alfalfa, clover, or even peanut hay being acceptable. All hay, of course, should be well cured and never musty or moldy. Oats, barley, wheat, and corn are also fed to the animals to balance their diet, with occasional small amounts of sulphur, charcoal, and codliver oil. Rabbits like carrots and should receive one occasionally. A block of salt should be placed in each hutch so that the rabbit may nibble at it. Feeding instructions and other hints in caring for rabbits are contained in bulletins issued by the Department of Agriculture and by some state universities.

Given proper care, rabbits usually remain healthy and free from many afflio tions that trouble other animals. Two se rious diseases, however, a nasal trouble known as snuffles and a worm infection called coccidiosis, are incurable. Rabbits infected by either should be destroyed at ? once and their hutches thoroughly sterilized to prevent spreading the disease. Most rabbit raisers feed their animals twice a day. Their appetite is a good indication of their state of health.

There are a number of other commercial breeds aside from the white New Zealand, including the red New Zealand, Elemish, Chinchilla, and Angora. The last two are raised exclusively for their fur or wool, which is extremely high priced. "Some people who have tried to raise rabbits in the past have dropped it when they failed to make money," declares Green, "but they shouldn't blame the rabbits. Raising them is a pleasant and profitable occupation and success with them takes proper management and attention to details just the same as in any other business. The fundamentals of success are good breeding stock, proper equipment and the right care."

Inquiries as to makers of articles described in Popular Mechanics will be answered by our Bureau of Information upon receipt of return postage.

A CLOCCED radiator may be the beginning of an expense account. The motor overheats. You lose power. Expensive repairs often result from a neglected radiator. Don't take a chance. You can keep radiators clean with Sant-Flush. Keep motors running cool and efficiently.

# The Wonders of Silent Sound

(Continued from page 213)

tric slab, repeated constrictions occur. The crystal slab and its electrodes are placed in a dielectric bath that serves to insulate the electrified plates, and the constrictions of the crystal set up vibrating waves in the liquid. Roughly speaking, a quartz disk slightly larger than a silver dollar and about three millimeters thick creates one million of such pressure waves per second. These are the ultrasonic vibrations so deadly to bacteria.

The mounting pressure waves in the dielectric bath cause the liquid to raise itself up into a solid mound above the crystal. If you should have a test tube partly full of water and insert the bottom of the tube in the mound of liquid, the water in the tube appears to boil violently, due to the jarring effect of the pressure waves. Oil and water in the test tube become so emulsified that the oil remains in suspension for days afterward. The hammering of the ultrasonic waves breaks the oil up into microscopic drops. It is this same continuous beating that shatters yeast and bacteria and that breaks starch down into dextrin.

Some of the research in supersonics is being conducted in secret because of its promising commercial possibilities. At the University of California at Los Angeles, however, Dr. Vern O. Knudsen is using the high-frequency waves purely as a scientific tool. Under Dr. Knudsen's direction the molecule is being attacked from a new front.

One of the quietest places in the world, where the silence is so oppressive that it seems to hurt, is the heavily padded "dead" room in the sub-basement of the sound laboratory on the U. C. L. A. campus. In this room sounds of different wave lengths are created, trained to travel in straight lines, pitched back and forth by huge parabolic reflectors, and are condensed and focused by means of zone plates that act as sound lenses.

The exact opposite of this dead room is a big reverberating chamber where slight sounds seem to magnify themselves to nerve-shattering intensity, bouncing back and forth between tuned metal plates and hard plaster walls, and echoing and rumbling long after the original sounds cease.

# The World of Tomorrow

(Continued from Colorato Section)

terns of nozzles, gas burners, fireworks receptacles and other equipment will be installed on a block-long platform beneath the surface of the lagoon. Two or three men will operate the show from a control room atop a near-by building. Because of the problems involved in amplifying music to a point where it can be heard above the rush of water, special musical scores must be prepared for the show.

The amusement zone spectacle will present an inferno of water, fire and color and will be staged from barges. There will be flame and water-throwing barges while light barges will bear searchlights, mercury vapor lamps and sodium floodlights, and fireworks barges will touch off the pyrotechnic displays. Others will launch silhouettes of gondolas so spectators will have a yardstick to judge the tremendousness of the scene. Captive balloons, played upon by searchlights, will provide the "ceiling" for the show.

The fair's most elaborate and costly artistic project will be a \$60,000,000, milelong Central Mall extending like a jeweled band across the main exhibit area. This Mall will be bordered by more than a score of the largest buildings, studded with heroic sculptures, inlaid with lagoons, enlivened by waterfalls and hundreds of fountains, accentuated by huge pylons and lined with more than 1,000 trees.

Dominating one section will be the largest portrait statue fashioned by man since the Egyptians hewed the figure of Rameses II out of rock—a sixty-five-foot figure of Washington as he appeared for his inauguration. Other huge figures, majestic murals and massive reliefs will adorn this area, as will a fifty-foot sun dial which will actually indicate time.

Not a light bulb or other visible source of illumination will be seen at night along the main section of the Mall. Instead, mercury vapor lights sunk in the ground will cast a soft glow into trees and foliage, causing the under sides of leaves to fluoresce and bathe the entire area in a luminous radiance, seemingly emanating from the trees, shrubbery and flowers.

Each exhibit zone will have its own key display, a spectacular "summary" of the

kind of exhibits in that area. In the transportation building, for example, the focal exhibit will include an intricate working model of an interplanetary rocketport of the future. Here visitors will see futuristic ships, planes and trains unloading passengers for a trip to Mars.

Then, as motors hum, signal lights twinkle and sirens scream, will come the breath-taking moment of departure. A crane picks up the rocketship and deposits it gently in the breach of a rocketgun. There is a brilliant flash, a muffled explosion and spectators see the rocket winging its way through the heavens.

One of the largest exposition buildings ever constructed, a modernistic S-shaped structure nearly one-fourth mile long, will house the most elaborate railroad exhibit ever assembled under one roof. Among the features will be the largest working model railroad ever built, an outdoor train display and a pageant of transportation.

In a million-dollar medical center man will see himself inside and out. Visitors will see the blood stream coursing through the body of a huge transparent man and hear his rhythmic heart beats as they enter this building. There will also be models of the human eye, the mouth and the skull so large that groups can walk inside and see what "makes the wheels go round."

In many cases, the design of a building will indicate the nature of its exhibits. A gas company building will be shaped like a huge burner, marine exhibits will be displayed in a structure whose entrance will resemble a waterfront pier flanked by the towering prows of two ocean liners, and aviation progress will be shown in a building representing a colossal plane emerging from its hangar.

Television will be demonstrated in the RCA building which will be linked directly with the NBC television transmitter atop the Empire State building, and the government's \$3,000,000 exhibit section will include nine large, semi-classic buildings dominated by an imposing federal structure. One feature will be great revolving murals, each of which will tell a story of government activity as it moves along the walls.

One of the outstanding features will be a \$1,500,000 "Town of Tomorrow," an ad-

vanced concept of community design and housing featuring new architectural treatment and the practical use of all modern house building materials, methods and equipment, together with suggestions for home decoration.

When a Gothamite starts reeling off fair facts and figures, he sounds like an astronomer discussing distances between planets, for some of the figures are so staggering as to make even New Yorkers a bit dizzy.

"We're going to set out 1,500,000 shrubs, 10,000 trees, grow 250 acres of grass, plant millions of flowers," he begins casually, "Fifteen million then shifts into high. square feet of walls will enclose fair buildings which will be stabilized by 308 miles of pilings. Into these buildings will go 15,000,000 board feet of lumber, 28,500 tons of steel, 400,000 barrels of cement, 9,000 tons of lighting materials and 12,000 tons of plaster board.

"There will be thirty-four miles of walks about 3,000,000 square feet of building area. We expect visitors to pass through the turnstiles at the rate of three per second. We anticipate an average attendance of 250,000 a day with 800,000 on peak days. Transportation is being planned to handle 160,000 visitors an hour."

To the seasoned fair-goer, all this probably sounds like sore feet. But this fair, despite its vast proportions, expects to have fewer aching feet per acre than any previous exposition. This is because it is being zoned like a city and related exhibits will be grouped so visitors interested in any particular subject will find everything relating to it in the same general area.

The site is shaped like an airplane and exhibits will be concentrated in the 390acre cabin section, amusements in the 280acre fuselage, a boat basin and docks will form the propeller, and the motor and tail will form parking space for 35,000 cars.

"Every building and exhibit of the fair will tie in with the central theme," says Grover Whalen, its president. "By reviewing yesterday and studying today, by telling man of his progress in the past and showing him the tools of the present, we hope to aid millions of people in charting a better and happier future. If we can do that, the New York World's Fair of 1939 will be a success, regardless of what the balance sheet shows when it is ended."

#### Believes Royal helped him get aboad!

"The day I got my Royal I started typing my reports. The boss liked it. Soon I had a larger territory. Now I have 5 men under me.

# Making Money with Pictures

(Continued from page 221)

had missed the picture rushed his roll to the developer. In thirty minutes his best shot was on the wire to a New York picture syndicate. It was a scoop! He could name his price, in three figures; and before many minutes other newspapers and syndicates were calling for his other shots.

It isn't often you catch the cameraman napping, however. Yet the amateur who, like Mr. Kirkwood, always keeps his "picture gun" in his pocket, loaded, has as good a chance as the professional to make a "killing." A dozen photographers might

Amateur scoop of 1938 is this, the only picture of the actual collapse of the Niagara Falls bridge

cover an intercollegiate foot race and only one capture the thrilling finish in the snapshot printed with this article.

What started as a routine assignment for Samuel Shere of International News Photos brought him first prize from Editor & Publisher magazine for the best news picture of 1937, a magnificent shot of the dirigible "Hindenburg" aflame at Lakehurst.

"The big ship was approaching the mast and was discharging water ballast," related Shere. "I was measuring her big hulk in my camera finder when I detected a flash of fire in her tail. Then came the first explosion that shook the ground. In that split second I pulled the trigger of my camera, recording the actual peak of the 'Hindenburg' disaster. As fast as I could, I took other shots. The flames finished her in thirty-two seconds. The heat was terrific. I ran toward the blazing ship and shot pictures of survivors. I was standing not far from the control cabin when the ship's small-arm ammunition went off. Someone yelled 'Fall down quick!' and I did until the firing ceased."

A young fellow who used to help a truck

driver bring farm produce from Michigan into Chicago heard there was pin money in pictures, so he took ten dollars out of the bank and bought a camera. The very next morning his truck swerved off the road to avoid crashing into a truck ahead. Getting out, he found a half dozen trucks "accordioned" into each other, with a passenger car in front. The first truck had been hauling four new automobiles. It was a "swell looking wreck." The problem was to get an angle that would take in the entire scene. He finally snapped a series of six pictures that could be arranged in a panorama. In Chicago he took his films to a newspaper office. They paid him twelve dollars for three prints, gave him the negatives, sent him upstairs to a wire association office where he collected fifteen dollars more. They told him where he might make some further sales, and two hours later he had sixty-five dollars.

If you had had some good exclusive pictures of the former Wallis Warfield of Baltimore at the time King Edward VIII of England abdicated to marry her, you might have sold them for \$50,000.

The highest price ever paid for news pictures for use in a single publication in the United States was for the photographs of the Byrd expedition at the South Pole. The seller was Wide World Photos; the buyer, Popular Mechanics Magazine-and the price was nearly \$4,000 for exclusive publication in the scientific field.

An English sailor on the airplane carrier "Hermes" was snapping pictures for his scrapbook while the Lindbergh seaplane, Col. and Mrs. Charles A. Lindbergh aboard, was being lowered into the floodwaters near Hankow, China, in the autumn of 1931. As the plane hit the water it capsized, hurling its famous occupants into the Yangtze river. The sailor's filmpack of twelve exposures showed the entire incident. After the rescue, the "gob" handed his negatives to his superior, who presented them to Colonel Lindbergh,

He decided to auction the pictures off to American newspaper interests, the money to be used for a home for British navy men on the Hankow waterfront. The New York Times offered \$9,000 for the pictures.

So it pays to keep your camera in your pocket, primed and ready. It need not be an expensive one, Better use one you can master. Keep it handy, keep it loaded, keep your eye open!

Make new or old buildings more attractive and waterproof. Plastic COLORCRETE fuses with any masomy surface. It disk all cracks. It can be sprayed in any thickness and in 30 colors. Pully proven by over twelve years actual use under all conditions and every climate.

Owners everywhere want to enhance values, you can supply this big waiting market with permanent COLORCRETE at amazingly low cost.

DRIVER Engineered POWER TOOLS

TAPS and DIES . . .

Accurate-carefully hardened and tempered. Complete range of sizes at your local five and ten cent store.

L. HANSON, WORCESTER, MASS.

# The Diesel in the Air

(Continued from page 163)

wind," were equipped with four 600-horsepower engines. Once again, they demonstrated the reliability of the Diesel by making fourteen trips over the same route.

Catapulting is used extensively for launching these Diesel-engined mailplanes, as Germany lacks bases from which to operate. Although this involves the use of catapult ships, it has the advantage that the plane can take to the air with full load without risking a take-off from a choppy sea. At present, catapulting is not suitable for passenger planes as the rate of acceleration is too rapid.

For long-range flights, the Diesel is particularly economical. This was demonstrated when a Dornier Do 18 flying boat made a 5,200-mile non-stop flight from the English Channel to Caravellas, in Brazil. This broke the world's long-distance seaplane record by nearly 1,000 miles, thanks to the remarkable fuel economy of the Junkers "Jumo" 205 engines. A fuel saving of approximately twenty-three per cent, compared with gasoline operation, is now obtained under average conditions. Another advantage is the saving in fuel cost. Aviation gasoline costs about eleven cents a gallon at refinery, compared with five cents a gallon for Diesel fuel.

Perhaps the most important factor is that Diesel fuel does not give off inflammable vapor at ordinary temperatures like gasoline, so there is no danger of an explosion from this source.

The Junkers factory is engaged in the type-testing of their 1,200-horsepower "Jumo" 206 Diesel, and in the construction of a new type which is to develop 2,000 horsepower. The latter will not follow the six-cylinder, in-line construction of their other Diesels, but will be a "square" engine with four banks of six cylinders and a crankshaft at each corner. So compact will the engine be, that its diameter will not exceed thirty-nine inches. Its weight will be about one pound per horsepower.

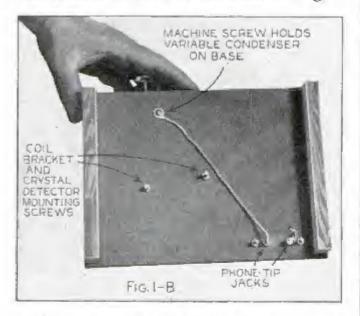

The United States, England, France. Japan and Russia are all working with the Diesel. Next year, huge flying boats carrying passengers and mail, powered with 2,000-horsepower Diesels, may take their place for transatlantic travel. Ultimately the Diesel may become the most popular power plant for long-distance flights.

# Low-Cost Receivers for Beginners

(Continued from page 259)

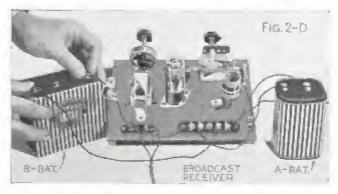

er for convenience. A lead is soldered to the terminal on the left side and run down to the spring clip on the crystal detector, the other spring clip on the detector being connected to the remaining phone-tip jack.

All four terminals on the antenna coil are numbered for identification in Fig. 1

and correspond to those shown in the schematic circuit diagram Fig. 1-A. The top end of the primary is No. 1 and the bottom terminal is No. 2; looking into the coil from the top, the upper end of the secondary is No. 3 and the lower end No. 4. Solder leads to each terminal lug and connect them exactly as shown in Fig. 1.

When completed, connect the antenna and run the ground lead to a clamp on a

cold-water pipe. Now plug a pair of good headphones into the tip jacks, move the "cat whisker" over the surface lightly until you find a sensitive spot and then tune in stations by rotating the condenser.

A set using a tube will pick up more stations with greater volume than a crystal receiver. Figs. 2, 2-A, 2-B, 2-C, 2-D and

(Continued to page 136A)

Ideal for boats or canoes because of its variable speed from maximum to just moving. So simple a child can operate yet strong and sturdy for general use. Operates 8-12 hours on good battery. Silent operation plus use of both hands for fishing and other features make it the perfect outboard. Free details.

(Continued from page 135A)

2-E show complete construction details for a one-tube receiver built up from the crystal-set parts-plus some new onesand the cost is quite reasonable.

A low-drain tube known as the RK-43, originally developed for use in radio equipment installed in meteorologic "weather balloons," is employed in this broadcast receiver and also in the shortwave set to be described. It is a dual-purpose tube which means that it is the equal of two ordinary tubes. With only 45 volts of B-battery voltage, this set will operate a small magnetic speaker on strong locals and has plenty of headphone volume on weak distant stations. A list of the original parts used in all three sets can be obtained from Popular Mechanics radio department without charge. The blue-

print, number R-256, however, will not be available until Part II of the article appears in the September issue. As the beginner should start with the crystal set, a complete description of the other receivers will be given later. For the broadcast set the crystal detector is removed and replaced with a 6-prong tube socket. The coil is modified slightly by removing 20 or more turns from the smallest winding (L2) which now serves as a "tickler." This is necessary to prevent excessive oscillation. Just enough turns are removed so that the set will drop in and out of oscillation smoothly as the regeneration control (R2) is turned. The 6.3-volt pilot-light bulb is connected in series with the positive B lead near the battery merely as a protective fuse and has no effect on the operation of the set.

# GAS ENGINE

It's easy and economical to supply your own power for operating all types of machinery, and do more work for less money. Simply remove the engine from a used automobile or truck, set it up where you like, attach a PIERCE UNIVERSAL GOVERNOR, start the engine and you have constantly controlled power for the operation of electric lighting plants, are welders, refrigerating upite, air compressors, feed grinders, hoists, saw mills and innumerable other applications.

The lead may charse but the PIERCE UNI.

The lead may change but the PIERCE UNI-VERSAL GOVERNOR will maintain a uniform engine speed. For close regulation of speed and dependable performance PIERCE GOVERN-ORB are never equalled, installation is simple. Either V or flat helts can be used. Complete Governor outfits are she available for pearly all makes and models of industrial angines.

Write for Mustrated literature and prices.

# Sectional Cabinet Relay Racks

(Continued from page 260)

Mounting brackets enable the builder to support completed chassis bases directly on the back of each front panel. Smaller mounting brackets are available for

mounting shelves to rack panels; these appear in the photo with the box-type dust cover for small units. Inter-stage shields and many other aids to the builder who is not equipped for metal working encourage the amateur to standardize his equipment and build efficient apparatus.

Photos A, B, C and D show complete metal cabinets suitable for housing receivers, testing equipment, small transmitters

and amplifiers. Some of the smaller metal cases now available to amateurs are provided with hinged covers and handles. Thus metal replaces the wooden cabinets formerly employed for housing amateur apparatus, and gives the beginner as well as the advanced experimenter an opportunity to construct radio equipment he can be proud of.

# Where Is Television Now?

(Continued from page 183)

probably has a frequency of sixty cycles per second-sixty pulses of flow in each direction-but sound broadcast stations use frequencies up to 1,500,000 cycles per second while television goes up around 50,000,000. And radio laboratories are experimenting with frequencies of more than a billion cycles per second!

Some of the most difficult problems of television result from these rapid reversals of current. We think of electricity as instantaneous but it is not. It has a speed of about 186,000 miles per second. So when we call upon a current to travel even a few feet and reverse itself—but to do this millions of times per second-we encounter limitations even in the speed of electricity.

Eighty-seven video programs were telecast by NBC last year. Only about 100 families, however, were able to enjoy these telecasts radiating from the antenna atop the Empire State building because there are only that many receivers in the New York metropolitan area, most of them in the homes of RCA and NBC engineers.

Engineers, designers, cameramen, costumers and directors work with special scene compositions, materials, colors and lighting in preparing a video performance. High-efficiency, non-glare lights have been developed for telecasting but the illumination required for a television scene is still somewhat greater than for the movies.

Most people assume television programs will be accompanied by sound but programs without sound have been found desirable in some instances. In fact, television may take up pantomime acting where Hollywood left it when the movies began

recording sound with sight.

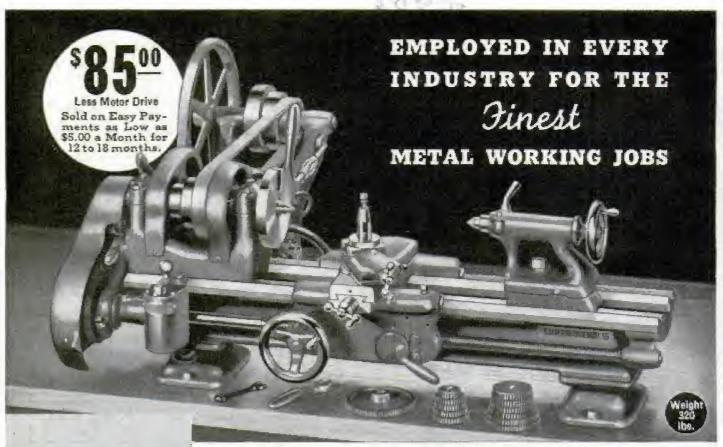

While passing through the earphone stage, television needs what radio needed in the days of crystal sets-hams and tinkerers. RCA recently made available to amateurs certain specialized parts, including several Kinescopes, and before long complete television kits containing all the parts for receivers may be available. Once the art emerges from the laboratory, the nation's hams and tinkerers will play an important part in its development.

And what of the hams who perform this labor of love? They will probably be the television-or video-servicemen and distributors of tomorrow.

SOUTH BEND BACK-GEARED SCREW-CUTTING PRECISION LATHE

This 9-inch South Bond Lathe used by: MANUFACTURERS TOOL ROOMS LABORATORIES MACHINE SHOPS

-Automotive Electrical Gun Smiths U. S. GOVERNMENT SCHOOLS HOME WORK SHOPS INVENTORS

The 9"x 3' South Bend Precision Lathe does these operations

these operations:

TURNS—BORES
—CUTS SCREW
THREADS—FACES
—DOES MILLING,
CHUCKING, REAMING, DRILLING,
FILING AND HUNDREDS OF OPERATIONS IN STEEL,
IRON AND OTHER
METALS.

There are 5 sizes of South Bend Lathes— 9", 11", 13", 15" and 16" swing with bed lengths 3' to 12". In motor or counter-shaft drives. Priced \$05 to \$1500. (\$15 Down-\$7 Monthly for 18 Months)

THE design and construction of the 9-inch Workshop Lathe guarantees doing jobs to the most exacting specifications. Workmanship and materials are of the highest standards that only our 32 years of manufacturing fine precision lathes can furnish. Used by every industry in the United States and abroad—the 9-inch Workshop Lathe is proving a profitable and productive investment. Features: Precision Lead Screw for screw threads 4 to 112 per inch, Ball Thrust Bearing on spindle, Automatic Longitudinal Screw Feed, Twin Gear Reverse to Lead Screw, 34" spindle hole taking collets up to 1/2". Takes 38 attachments for milling, grinding, draw-in collet chuck work, taper work, and other jobs. SOUTH BEND LATHE WORKS 632 E. Madison St., South Bend, Ind., U.S.A.

# PROOF THAT EVERY CAR IS THREE-CARS-IN-ONE

## Poor performance

with "low-grade" gasoline

There is no anti-knock fluid (containing tetraethyllead)in "low grade" gasoline. Power is lost because the spark must be retarded by your car dealer to prevent "knock" or "ping."

#### Good performance

with "regular" gasoline

Most regular gasoline has initanti-knock fluid (containing tetraethyl lead). The spark can be considerably advanced for more power without "knock" or "ping."

# Best performance

with easoline containing "ETHYL"

Gas" with ETHYL" is highestinall-roundquality. It has enough antiknock fluid (containing tetraethyl lead) to let the spark be fully advanced for maximum power and economy without "knock" or "ping."
